Personal comments: Although there was disagreement amongst the panel the data are actually derived from more than one sort of thing, all agreed that there are large unidentified objects in Loch Ness that require a rational explanation. Certainly this is an important step forward for this work, since many critics have regarded the "monsters" as a complete myth having no substance whatever. The weight of the data collected by the Rines-Wyckoff group has slowly had an impact on those willing to consider it in detail and the presentations before Parliament and at Cornell together with positive comments by several prominent scientists elsewhere, have given credibility to this team's efforts. This increased confidence was recently demonstrated by the announcement that The New York Times has decided to financially support this summer's effort. The Academy team left for Loch Ness on May 30 for a full summer's work. This is being covered by an NBC film crew and Times reporters and photographers have been sending back regular dispatches. The methods being used this summer are more extensive and sophisticated than ever before used at Loch Ness. This, coupled now with the cooperation of several zoologists and paleontologists at the Loch, gives hope that we may indeed be on the verge of resolving the mystery first recorded by St. Columba fourteen centuries ago.

Those readers who wish to consider in greater detail the more extensive photographic and sonar evidence collected to date by the Academy team should write for a copy of the article by Rines et al. (1976), available for $1.00 per copy from "Ness", Technology Review, Room E19-430, Massachusetts Institute of Technology, Cambridge, Mass. 02139.

I acknowledge my gratitude to Mr. Wyckoff and Mr. Dennis L. Meredith for the photos used here.

FIGURE 1 Three-dimensional map of Urquhart Bay, located midway along the west shore of Loch Ness. The ruins of Urquhart Castle stand on the promontory at the extreme left and the Enrick and Coiltie rivers enter Loch Ness here. Most of the work of Wyckoff's group has been done in the shallow waters along the gently-sloping shelf shown at the upper right in this drawing. The vertical dimension is expanded about 3 times to emphasize the bottom contours; horizontal lines mark 100 ft intervals of depth, the deepest one shown here at 500 ft. (copyright Academy of Applied Science)

FIGURE 2 The famous "surgeon's photograph" taken by Dr. Robert K. Wilson, a London gynecologist. The photo was taken in April 1934 about 2 mi north of Invermoriston, along the west shore of Loch Ness below Urquhart Bay. This is the first of a pair of photos, the second showing the object leaning "forward" when it submerged. Until the recent photos, this one attracted the most publicity since there has been no evidence of tampering with the negatives but it is merely a silhouette and shows no surface detail. It has been interpreted as the head and neck of a monster, although some claim it is merely a bird's neck or an otter's tail. (copyright Associated Newspapers)

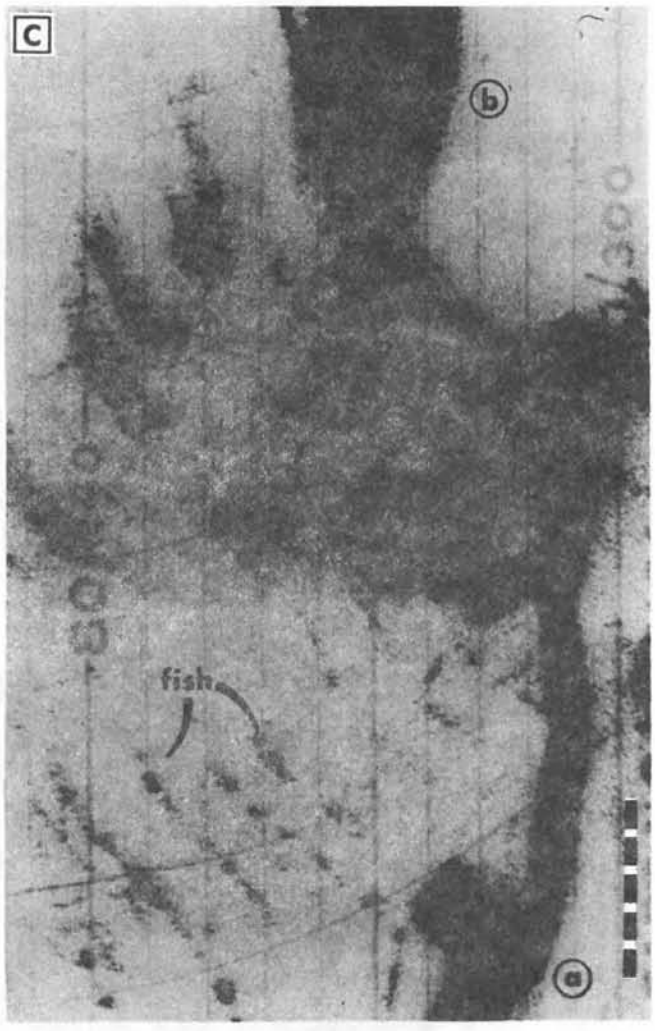

FIGURE 3 First underwater photographs and associated sonar record of the Loch Ness monster, taken on 9 August 1972. (A) and (B) are the so-called "flipper" photos, shown here computer-enhanced and duplicated with higher-than-normal photographic contrast. (B) was taken 45 sec after (A) and measurements from these indicate a "flipper" length of 4-6 ft; they are estimated to be about 4 ft from the camera. The tiny black triangles in one corner of each photo are caused by the strobe apparatus and should be disregarded. Simultaneously, the sonar record (C) was obtained using a Raytheon model DE 725C echo sounder with a frequency of 200 kHz. The record reads in 6-ft intervals (indicated by the faint vertical lines) from the sonar apparatus that was located to the left; the vertical axis reads in time, from 1:45 to 2:00 AM, bottom to top respectively. The period during which photos (A) and (B) were taken is indicated by the dashed line at the lower right in (C). According to Wyckoff, sonar experts have interpreted this record as showing a moving school of fish (the series of faint, parallel lines moving diagonally across the record) and two large objects (a, b) separated by a distance of about 12 ft; one of them (a) has large protuberances or "appendages" on one side. Both the sonar transducer and camera-strobe apparatus were located at depths of 35 and 45 ft, respectively, about 120 ft from shore (see Fig. 1). (copyright Academy of Applied Science)

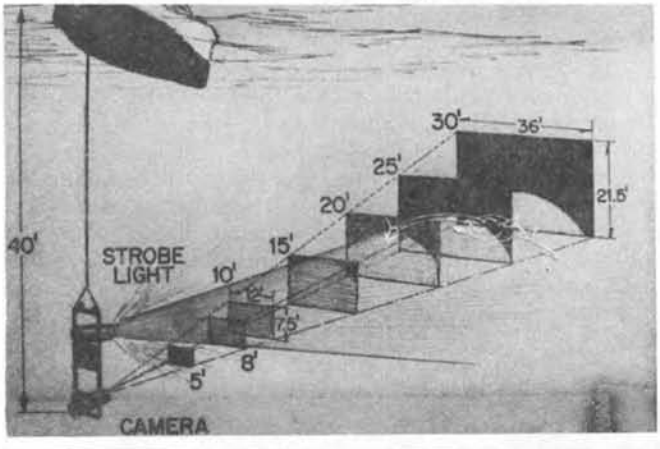

FIGURE 4 Camera-strobe arrangement for photographs shown in plate I, showing apparatus suspended from a boat. The camera field of view intersected the strobe beam at an angle in a way that only objects at a distance of 10 ft were fully illuminated. This geometric arrangement, together with light density measurements, was used by Wyckoff to determine the distance and size of an object. Included here is a schematic of the object shown in plate IA. At this distance the "body" would be fully illuminated but the "head," since it extends toward the camera, would cast a shadow over part of the "neck" making the object in plate IA appear to be two separate structures. (copyright Academy of Applied Science)

PROGRAM and ABSTRACTS

of the

19th Annual Meeting of

THE SOCIETY FOR THE STUDY OF AMPHIBIANS AND REPTILES

A Joint Meeting with

THE HERPETOLOGISTS LEAGUE

8 - 12 August 1976

Miami University, Oxford, Ohio

SCHEDULE OF EVENTS

All times are EDST

The Contributed Papers Sessions and the Symposium will be held in the Miami University Student Center in the Towers Room and the Heritage Room (second floor of the Center).

8 Aug., Sunday	- 1200-1730	- Registration, Lobby, Miami Univ Student Center
	- 1400	- Herp. League Bd. Meeting, Room 239
	- 1600	- SSAR Board Meeting, Room 237
	- 2000	- Joint SSAR-HL Meeting, Room 237
	- 2000	- Informal Slide Show, Towers Room
9 Aug., Monday	- 0800-1200	- Registration, Lobby, Univ. Center
	- 1300-1700	- Registration, Lobby, Univ. Center
	- 0800	- Call to Order, Heritage Room
	- 0830-1200	- Symposium on Reproductive Biology of Amphibians begins. Opening remarks by Dr. Uzzell in Heritage Room.
	- 0800	- Committee on Resources in Herpetology Meeting, Room 239
	- 1300-1715	- Symposium
	- 2000	- Social - Hueston Woods Lodge
10 Aug.,Tuesday	- 0800-1145	- Symposium
	- 1300-1700	- Symposium
	- 1700	- SSAR Business Meeting (Heritage Room)
	- 2000	- Chicken Dinner (Pfeffer Park)

11 Aug., Wednesday - 0830-1200 - Contributed Papers (Heritage and Towers Rooms).
- 1330-1715 - Contributed Papers (Heritage and Towers Rooms).
Informal Wednesday evening activities are being planned and will be announced Wednesday afternoon.

12 Aug., Thursday - 0830-1200 Contributed Papers (Heritage and Towers Rooms).

Times of the contributed papers will be mailed to each participant and pre-registrant. Others will receive them in their registration packet, or by mail, if requested.

We have scheduled 86 contributed papers to be presented Wednesday and Thursday morning. The large number of papers necessitated that we schedule concurrent sessions.

Directions to Miami University - see attached map.

Housing: An air-conditioned conference dormitory (Morris Hall) is located one block away from the University Center. Conference dormitory rates are: $6.00 per day per person for a double room and $8.50 per person per day for a single room (towels and sheets provided). The check-in counter is located in the lobby of Morris Hall and a desk clerk will be on duty 24 hrs/day.

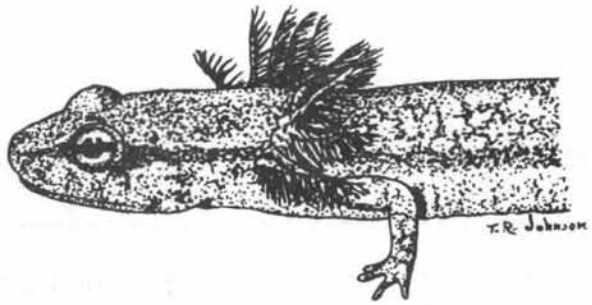
Room fees should be paid upon check-in. In order to facilitate check-in at the Conference Center, we would appreciate your filling out the housing form attached to the pre-registration packet and returning it when you pre-register. These facilities are convenient and are run in a manner similar to that of a motel. A limited number of family suites are also available. If you prefer to stay in a motel the following moderately priced motels are within three miles of campus:

College View Motel
South U.S. 27
Oxford, OH 45056
Tel: 513-523-6311

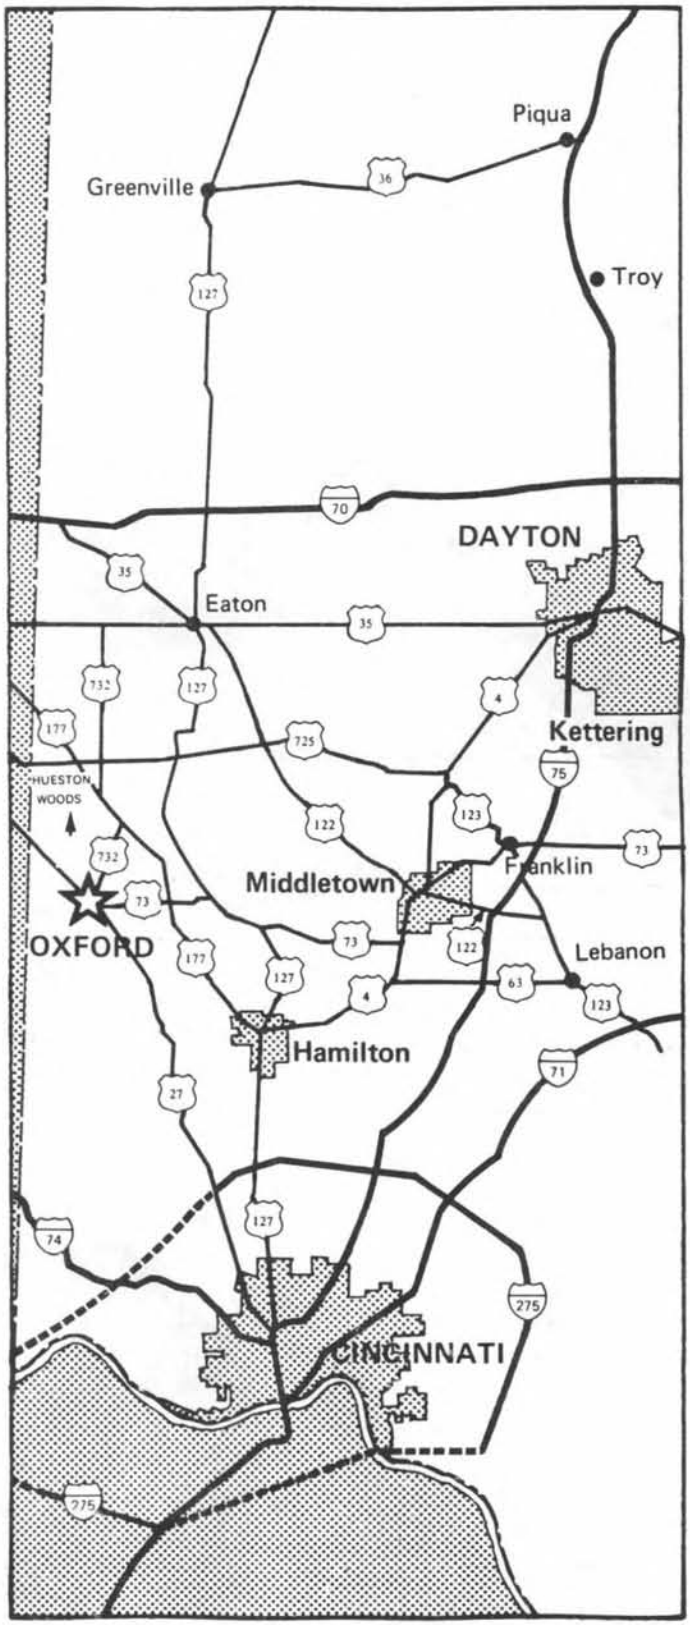
Miami Motel
West 27
5235 College Corner Pike
Oxford, OH 45056
Tel: 513-523-6306

Oxford Motel
West 27
Oxford, OH 45056
Tel: 513-523-4166

Camping Facilities: Both Tent and Recreational Vehicle Camping Sites (350) are located five miles away at Hueston Woods State Park (reservations may be made by writing, or calling, Hueston Woods State Park, Rt. 1, College Corner, OH, 45003, (513) 523-6347; Reservations may be made up to 30 days in advance.



Food: The University Union has a cafeteria, an excellent restaurant and two snack bars for meals and snacks. Additionally, restaurants in uptown Oxford are only a 10 minute walk. Recreational rooms and services will also be open during the meeting, i.e., bowling, pool tables, T.V. rooms, etc.



Herp Art Showing: A number of people have indicated an interest in displaying paintings, and other artwork, of amphibians and reptiles at the meeting. A room has been reserved for this purpose at the University Center. Anyone who wishes to exhibit paintings, photographs, sculpture, etc., please contact Douglas H. Taylor, Dept. of Zoology, Miami Univ., Oxford, OH 45056 (Tel: 513-529-4901) by 2 August 1976 relative to what, what size and how many items you wish to exhibit. Any information related to needs in order to arrange your exhibit should also be included.

Extra-Meeting Activities: Trips to Cincinnati Zoo, Cincinnati Art Museum, Hueston Woods Nature Center and other points of interest are planned. Hueston Woods Beach and Swimming Area is close by and open for our use.

Exhibits:

Live Animals: A display of Ohio herps will be set up in the University Center. Ohio herpetologists are encouraged to assist in developing this exhibit. Anyone who can lend Ohio herps for this purpose please contact Sheldon Guttman, Dept. of Zoology, Miami Univ., Oxford, OH 45056 (Tel: 513-529-4595).

GRAY-BELLIED SALAMANDER
1 3/4-3¼ inches
(neotenic)

Pre-Registration Forms

The registration fee includes the cost of meeting rooms, social, coffee breaks, printing and mailing, chicken Bar-B-Que, etc. Pre-registration is $10.00. Registration after August 2 and at the meeting will be $12.00. ONLY send in pre-registration and group photo payments now. Pay for housing upon check-in.

NAME _____

ADDRESS _____

_____ ZIP CODE _____

ARRIVING _____ (DAY, DATE) LEAVING _____ (DAY, DATE)

HOUSING REQUIREMENTS
(Pay for housing upon check-in)

_____ Nights double occupancy at $6.00/night/person

_____ Nights single occupancy at $8.50/night/person

FAMILY ACCOMODATIONS: A limited number of family suites are available.

_____ Number of beds needed at $6.00/night/person

PRE-REGISTRATION

_____ Pre-registration fee(s) at $10.00 per person $____

_____ Group photos (B&W, 8 x 10) at $1.00 (postage included) $____

MAKE CHECKS PAYABLE TO: SSAR-HL: MIAMI UNIVERSITY
MAIL THIS FORM BY 26 JULY, 1976 TO:
DOUGLAS H. TAYLOR, DEPARTMENT OF ZOOLOGY, MIAMI UNIVERSITY, OXFORD, OHIO 45056

AIRPORT PICK-UP FORM
(Cincinnati, OH Airport ONLY)

I will be arriving at Cincinnati on _____ (Airline) Flight Number _____

on _____ (Day, Date) at _____ (Time); use time as indicated by airline. Cincinnati is EDT. Look for someone holding a sign saying "SSAR-HL" in front of the TWA ticket counters.

*****ALL FORMS MAY BE MAILED TOGETHER OR SEPARATELY. SEND TO: DOUGLAS H. TAYLOR, DEPARTMENT OF ZOOLOGY, MIAMI UNIVERSITY, OXFORD, OHIO 45056

MONDAY, Aug. 9
Heritage Room

Symposium: Reproductive Biology of Amphibians
(All Sessions, Thomas Uzzell, Philadelphia Academy of Natural Sciences, Presiding)

0800 Call to Order, James Vial, (University of Missouri, Kansas City) Chairman, SSAR.

Announcements: Meeting Co-Chairmen.

0830 Introduction of the Symposium, Thomas Uzzell, (Philadelphia Academy of Natural Sciences)

0845 Reproductive Ecology of North American Plethodontids. Stephen G. Tilley (Smith College, Northhampton, Massachusetts)

0935 Reproductive biology of Paedogenic Salamanders. Max A. Nickerson (Milwaukee Public Museum, Milwaukee, Wisconsin)

1025 -- COFFEE BREAK --

1045 Reproductive biology of neotropical salamanders. Lynne Houck (Museum of Vertebrate Zoology, University of California, Berkeley, California)

1135 --LUNCH--

1330 The reproductive biology of caecilians. Marvalee H. Wake (University of California, Berkeley, California)

1420 Aspects of the reproductive biology of Japanese amphibians. Toshijiro Kawamura (Laboratory for Amphibian Biology, Hiroshima, Japan)

1510 --COFFEE BREAK--

1530 The courtship behavior of new world salamanders. Steven J. Arnold (University of Chicago)

1620 The comparative reproductive ethology of European newts: An evolutionary perspective. T. R. Halliday (Animal Behavior Research Group, Oxford, England)

TUESDAY, Aug. 10
Heritage Room

0830 The evolution of courtship behavior in Anurans. K. D. Wells (Smithsonian Tropical Research Institute)

0920 Divergence, convergence and stability in Anuran acoustic signaling systems concerned with reproduction. Murray Littlejohn (University of Melbourne, Australia)

1010 --COFFEE BREAK--

1030 Auditory behavior and physiology of vocalization in the European tree frog, Hyla arborea (L.). Hans Schneider (Zoologisches Institut Universitat, Bonn, Germany)

1120 Auditory processing of vocal signals in anurans. Robert Capranica (Cornell University)

1210 --LUNCH--

1330 Systematics and hybridization in the Rana esculenta complex. Leszek Berger (Polish Academy of Science, Poland)

1420 Reproduction and mating behavior in Rana lessonae - Rana esculenta mixed populations. Hansjorg Blankenhorn (Zoologisches Institute des Universitat, Zurich, Switzerland)

1510 --COFFEE BREAK--

1530 Cytotaxonomic and cytogenetic investigations in European newt species. Giorgia Mancino (Instituto di Zoologia dell 'Universita Pisa, Italy)

1620 Concluding Remarks: Thomas Uzzell, (Philadelphia Academy of Natural Sciences)

WEDNESDAY, Aug. 11
Heritage Room

Contributed Paper Session
(Morning Session, George Murphy, Middle Tennessee State University, Presiding)

0830 Orientation by means of polarized light in bullfrog tadpoles, Rana catesbeiana. Jill Shore Auburn and Douglas H. Taylor (Miami University)

0845 Chameleons of Madagascar (a motion picture film by the late Dr. Stephen R. Parcher). (University of Oklahoma)

0900 Life history phenomena in the American toad, Bufo americanus. Debra C. Casebere and Douglas H. Taylor (Miami University)

0915 A comparative study of orientating mechanisms utilized by three species of turtles (Chrysemys picta, Trionyx spiniferus, Terrapene c. carolina). Christopher T. DeRosa and Douglas H. Taylor (Miami University)

0930 Species discrimination in mate selection by free-living male garter snakes and experimental evidence for the role of pheromones. Michael C. Devine (University of Michigan)

0945 Antipredator mechanisms of neotropical salamanders. C. Kenneth Dodd Jr. (National Museum of Natural History) and Edmund D. Brodie Jr. (Adelphi University)

1000 -- COFFEE BREAK --

1015 Homing to the nest by female Desmognathus ochrophaeus, with comments on the sensory modalities essential in clutch recognition. Don C. Forester (Towson State University)

1030 Feeding behavior in the snakes Regina alleni and Regina rigida. Richard Franz (Florida State Museum, University of Florida)

1045 Reproductive behavior of the Rat snakes of eastern North America, genus Elaphe. James C. Gillingham (University of Oklahoma)

1100 Coral snake mimicry: does it occur? Harry W. Greene (University of Tennessee)

1115 Individual differences in the vocalizations of the Bullfrog, Rana catesbeiana. James D. Haas (Tufts University)

1130 Path characteristics in a population of Eastern Box turtles. Stephen P. Hall (University of North Carolina)

1145 Mating strategies in Rana catesbeiana. Richard D. Howard (University of Michigan)

1200 Rib penetration as an antipredator mechanism in Pleurodeles waltl. Robert T. Nowak and E.D.Brodie Jr (Adelphi University)

1215 -- LUNCH --

WEDNESDAY, Aug. 11
Towers Room

Contributed Paper Session
(Morning Session, Joseph Tihen, University of Notre Dame, Presiding)

0830 Analysis of aerial locomotion in Ptychozoon lionatum, with a reconsideration of gliding and parachuting in vertebrates. Brian D. Clark (University of Michigan)

0845 Natural selection and anuran locomotion. Martha L. Crump and Stanley N. Salthe (Brooklyn College of City University of New York)

0900 Concentrations of lactic acid in neotenic and transformed Tiger salamanders (Ambystoma tigrinum) before and after activity. Janette R. Cushman and Gary C. Packard (Colorado State University)

0915 Durophagic adaptations of Dracaena guianensis. G.H. Dalrymple (Ohio State University)

0930 Effects of simultaneous and sequential treatments with estradiol and progesterone on the oviduct in ovariectomized Anolis carolinensis. James D. Fawcett (University of Nebraska)

0945 The role of the trunk in the locomotion of some scincid lizards. Robert M. Fisk (University of Chicago)

1000 --COFFEE BREAK --

1015 Histological changes in the thyroid of ovariectomized Anolis carolinensis following estradiol and testosterone treatments. Juliann D.-U. Gong, Elizabeth S.-F. Chao and James D. Fawcett (University of Nebraska)

1030 Testicular responses to different doses of melatonin in the lizard Anolis carolinensis . John R. Krouse, Frank J. Evans and James D. Fawcett (University of Nebraska)

1045 A preliminary look at the evolution of form and function in the costocutaneous muscle system in marine snakes. Bruce C. Jayne and Harold K. Voris (Field Museum of Natural History)

1100 The systematic significance of variation of the coccyx in some South American leptodactylid frogs. John D. Lynch (University of Nebraska-Lincoln)

1115 Effects of thermal and water stress on heart rate in Bufo americanus and Bufo marinus . Elizabeth Sherman Novotny (University of Vermont)

1130 Melanin deposits associated with the venom glands of snakes. F. Harvey Pough, G. Kwiecinski, and W. Bemis (Cornell University)

1145 Morphology of the neck region in Coluber constrictor (Serpentes: Colubridae). Gregory K. Pregill (University of Kansas)

1200 Seasonal ovarian histology of the Eastern Collared lizard, Crotaphytus collaris collaris (Say), from Arkansas. Stanley E. Trauth (Auburn University)

1215 --LUNCH --

WEDNESDAY, Aug. 11
Heritage Room

Contributed Paper Session
(Afternoon Session, Stephen R. Edwards, Museum of Natural History, University of Kansas, Presiding)

1330 Hormonal influences on calling and reproductive behavior in anura. Hans-Joachim Obert (Zoologisches Institut der Universitäet, Bonn, Germany)

1345 The influence of melatonin on reproductive state in male Callisaurus draconoides. Mary J. Packard and Gary C. Packard (Colorado State University)

1400 Color preference in Eumeces inexpectatus. Stephen A. Perrill (Butler University)

1415 Possible use of weak magnetic fields by orienting salamanders. John B. Phillips (Swarthmore College)

1430 The natural food and feeding behavior of a marine snake, Enhydrina schistosa (Hydrophiidae). Harold K. Voris and Helen H. Voris (Field Museum of Natural History)

1445 Sun compass orientation in four species of Ambystoma. Libby House Tomson (Mississippi State University)

1500 -- COFFEE BREAK --

1515 Ethology, Karyology and taxonomic position of the South American leptodactylid frog genus Edalorhina. James P. Bogart (University of Guelph, Canada)

1530 Variation and systematics of the Desmognathus monticola complex. Ronald S. Caldwell and George W. Folkerts (Auburn University)

1545 Biochemical systematics of Rana in western North America. Susan M. Case (University of California, Berkely)

1600 The Ameiva (Sauria, Teiidae) of trans-Andean South America: Trends in geographic variation and a new species. Arthur C. Echternacht (University of Tennessee)

1615 Evolutionary considerations of sizes and shapes in Giant Tortoises of the genus Geochelone in the Galapágos Islands. Thomas H. Fritts (San Diego Natural History Museum)

1630 Sperm morphology in the Hyla rubra group, and its bearing on generic status. M.J. Fouquette, Jr. and A.J. Delahoussaye (Arizona State University)

1645 Biogeography and distribution of Iguana and Cyclura in the Greater Antilles. Steven Garber (Cornell University)

1700 A computer approach to the biogrography of the herpetofauna of the Pacific lowlands of western Mexico. L.C. Garcia-Lozano and J.S. Godley (University of South Florida)

WEDNESDAY, Aug. 11
Towers Room

Contributed Paper Session
(Afternoon Session, Charles Chantell, University of Dayton, Presiding)

1330 Scanning electron microscopy of some salamander spermatozoa. J.W. Edward Wortham Jr. and Judith A. Murphy (Old Dominion University)

1345 The influence of light upon activity rhythms of five syntopic anuran larvae. Thomas J. Berger (University of Missouri) and James L. Vial (University of Tulsa)

1400 Breeding biology of the Cascade frog, Rana cascadae. Jeffrey Briggs (University of Wisconsin-Milwaukee)

1415 Species diversity of stream salamanders on two southern Appalachian watersheds with contrasting vegetation types. John E. Cadle (University of Georgia)

1430 Local geographic variation in demographic parameters and body size of Desmognathus fuscus (Amphibia: Plethodontidae). Rudolph Theodore Danstedt, Jr (University of Maryland)

1445 Patterns of mate-seeking and burrow use in a southern Florida population of Gopherus polyphemus. John F. Douglass (University of South Florida)

1500 --COFFEE BREAK--

1515 A population study of the northern watersnake, Natrix sipedon, in southeastern Michigan. Paul E. Feaver (University of Michigan)

1530 Ontogenetic shifts in food habits of a crayfish eating specialist: Regina alleni (Serpentes: Colubridae). J. Steve Godley (University of South Florida)

1545 Studies in larval amphibian habitat partitioning. W. Ronald Heyer (Smithsonian Institution)

1600 The identification of pedunculate barnacles found on Malaysian sea snakes with notes on their mode and site of attachment. William B. Jeffries and Harold K. Voris (Field Museum of Natural History)

1615 Effects of temperature and moisture on the foraging of Desmognathus ochrophaeus. W. Hubert Keen (Kent State University).

1630 Comparative demographic ecology of Desmognathus in western Pennsylvania. Anthony Krzysik (University of Pittsburgh)

1645 Studies on the polymorphic salamander Plethodon cinereus in New England: Ecological differentiation of the morphs and reproductive ecology. Fred Lotter and Norman J. Scott, Jr. (University of New Mexico)

1700 A field study of the northern prairie lizard, Sceloporus undulatus garmani. Luis Malaret (University of Kansas)

THURSDAY, Aug. 12
Heritage Room

Contributed Paper Session
(Morning Session, Dennis Ralin, Kentucky State University, Presiding)

0800 Protein evidence for a narrow zone of hybridization between the chorus frogs Pseudacris triseriata and P. nigrita. Donald F. Garthside and Herbert C. Dessauer (L.S.U. Medical Center)

0815 Systematics and evolution of Cnemidophorus tigris east of the Continental Divide. Fred S. Hendricks (Texas A&M University)

0830 Significance of morphological variation in three species of Desmognathus (Caudata: Plethodontidae). Eric J. Juterbock (Ohio State University)

0845 A biochemical and morphological analysis of the relationship of Plethodon longicrus and P. yonahlossee. Alvan A. Karlin, Sheldon I. Guttman, David M. Dennis and George M. Labanik (Miami University)

0900 Convergent evolution in the hylid frog, Anotheca. Linda Maxson (University of Illinois-Urbana)

0915 Chromosomes and the relationship of the scincid lizard Neoseps reynoldsi Stejneger. Roy W. McDiarmid and John W. Wright (University of South Florida)

0930 A gynandromorphic Cnemidophorus inornatus (Sauria: Teidae). Joseph C. Mitchell and M.J. Fouquette, Jr. (Arizona State University)

0945 Relationships within the genus Acris (Anura: Hylidae) in Alabama. William L. Phillips and Robert H. Mount

1000 -- COFFEE BREAK --

1015 Behavioral and genetic differentiation in a diploid-tetraploid cryptic species complex of treefrogs. Dennis B. Ralin (Kentucky State University)

1030 Identity of an enigmatic Eurycea (Urodela: Plethodontidae) from the Great Smoky Mountains of Tennessee. David M. Sever (Saint Mary's College)

1045 Chromosome evidence for the different phyletic lines in the frog genus Eusophus (Amphibia: Leptodactylidae). Alberto Veloso and Patricia Iturra (University of Kansas)

1100 A new species of plethodontid salamander from the California desert. David B. Wake and Ronald W. Marlow (University of California-Berkeley)

1115 The immunological comparison of caecilian albumins. Marvalee H. Wake and Susan M. Case (University of California-Berkeley)

1130 Enzymatic inheretance in the Queen Snake, Regina septemvittata. Craig Weatherby (Auburn University) and Sheldon I. Guttman (Miami University)

1145 Geographic variation in Sceloporus parvus Smith. Fred H. Wills (Texas A&M University)

1200 An analysis of rates of chromosome evolution and speciation in vertebrates. A.C. Wilson (University of California-Berkeley), G.L.Bush (University of Texas), S.M. Case University of California-Berkeley), J.L.Patton,(Univ Calif-Berkeley) and M. C. King (Univ Calif-San Francisco)

THURSDAY, Aug. 12
Towers Room

Contributed Paper Session
(Morning Session, David Snyder, Austin Peay State University, Presiding)

0800 Competition avoidance mechanisms in three species of Desmognathus. William T. Maple (Bard College)

0815 The occurence of neotenic rough-skinned newts (Taricha granulosa) in montane lakes of southern Oregon. Michael S. Marangio (Lousiana State University)

0830 Resource partitioning by lizards in a cave habitat. William J. Mautz (Cornell University)

0845 Preliminary remarks on introduced populations of frogs (Xenopus laevis) in Southern California. Michael J. McCoid (San Diego Natural History Museum)

0900 Geographic body size variation, life history, and growth among populations of a streamside salamander (Desmognathus brimleyorum) on adjacent mountains. Bruce Means (Tall Timbers Research Station)

0915 A demographic Study of the Chorus Frog, Pseudacris triseriata. Paul Miller (Colorado State University)

0930 Ecological study of Tropidurus peruvianus in southern Peru. Jaime E. Pefaur (University of Kansas)

0945 Reproduction and growth in the turtle, Trionyx muticus. Michael V. Plummer (Harding College)

1000 -- COFFEE BREAK --

1015 Physiological basis of habitat partitioning in Jamaican Eleutherodactylus. F. Harvey Pough, Margaret M. Stewart and Richard G. Thomas (State University of New York at Albany)

1030 The status of the Houston Toad, Bufo houstonensis. Okla W. Thornton and Robert A. Thomas (Texas A&M University)

1045 Comparative demography of Basiliscus basiliscus. Robert Wayne Van Devender (University of Michigan)

1100 Differential predation on tadpoles, metamorphosing individuals and frogs by garter snakes (genus Thamnophis). Richard J. Wassersug and Stevan J. Arnold (University of Chicago)

1115 Amphibian productivity in a northern Michigan pond. J. Kirwin Werner and Mark B. McCune (Northern Michigan University)

1130 Terrestrial activity of Kinosternon baurii in a seasonal hardwood swamp forest. Mark L. Wygoda (University of South Florida)

1145 The ecology of the bog turtle, Clemmys muhlenbergi, in western North Carolina. Robert T. Zappalorti (Staten Island Zoo)

1200 Selected aspects of the ecology of Rainbow snakes, Farancia erytrogramma. J.W. Gibbon, J.W. Coker and T.M. Murphy (Savannah River Ecology Laboratory)

1215 The evolutionary significance of overwintering in the nests by turtles. J.W. Gibbons and D.H. Nelson (Savannah River Ecology Laboratory)

ABSTRACTS

Symposium: Reproductive Biology of Amphibians

Arnold, Stevan J. (Department of Biology, University of Chicago, Chicago, Illinois). The Courtship Behavior of New World Salamanders.

There is a considerable body of descriptive work on the courtship behavior of New World salamanders, but little experimental analysis of function. Even the descriptive record is incomplete. We know nothing about courtship in the following genera: Phaeognathus, Leurognathus, Batrachoseps, Lineatriton, Oedipina, Thorius, Parvimolge, Gyrinophilus, Stereochilus, Typhlomolge, Typhlotriton, Haideotriton, Rhyacosiredon, Pseudobranchus and Siren. The published accounts of courtship in Necturus and Amphiuma are so incomplete that no meaningful interpretations are possible. The aim of this paper is to survey our knowledge and provide some inferences about function that may help to guide experimental investigations.

Some aspects of courtship have evolved rapidly, while other traits have had a very conservative history. Male actions that occur in the early stages of courtship seem particularly prone to rapid evolution. For example, the first reactions of the male to the female vary considerably between species in the genus Plethodon and in the genus Ambystoma. A specialized movement of the forelimbs is unique to the genus Desmognathus. Actions that occur later in courtship, particularly those associated with sperm transfer, seem to evolve slowly. The placement of the spermatophore is especially conservative. Salamanders in four families characteristically deposit the spermatophore just in front of the female's head. Other aspects of sperm transfer are characteristic of particular families (e.g., the tail-straddling walk of plethodontids, a right angle turn after spermatophore deposition in salamandrids, the number of spermatophores per courtship). We may be able to interpret such evolutionary patterns when our understanding of courtship functions is more complete.

There is surprisingly little experimental work on the phenomena of sex and species identification. Male Ambystoma and Plethodon recognize the sex of potential partners, but the mechanism is unknown. Chemoreception is a good candidate for the principal sensory modality used in sex identification. Capacity for species identification has been demonstrated experimentally in Taricha and Ambystoma. Species identification is made by chemoreception in Taricha. Nasolabial grooves and cirri may be used by plethodontids in sex and species identification.

Some male behaviors are apparently used to assay and change the female's sexual receptivity. Actions with these supposed functions are characterized by repeated application of glandular secretions. In plethodontids the mental gland is repeatedly applied to the female before and/or during the tail-straddling walk. Apparent delivery of mental gland secretions is accomplished in two ways: by applying the gland to the female's nares or by introducing the secretions into the secretions into the female's circulation by scratching with the premaxillary teeth. In some Ambystoma the male rubs his chin over the female's nares while clasping her dorsum. A similar action occurs in Taricha. Male Taricha have submaxillary glands, but Ambystoma have not been examined. In Notophthalmus genial glands are rubbed across the female's nares during clasping. Male Notophthalmus will delete clasping and use of the genial glands if the female is very receptive. A comparison of Ambystoma and Plethodon suggests that the probability of successful sperm transfer is related to the duration of preliminary courtship.

Behavioral interactions between rival males seem to serve two functions: defensive monopoly of the female (sexual defense) and usurpation of insemination (sexual interference). Male salamanders monopolize the female by transporting her away from rivals (Ambystoma, Taricha) or by chasing rivals away from her (plethodontids and Rhyacotriton). Covering the spermatophores of rivals (Ambystoma) and mimicry of female behavior (Ambystoma and Plethodon) are probably examples of sexual interference.

Berger, Leszek. (Polish Academy of Sciences, Poznani, Poland). Systematics and hybridization in the Rana esculenta complex.

The water frogs of Middle Europe form three morphological types of two of which, Rana lessonae Cam. and Rana ridibunda Pall., are species, while the third, Rana esculenta L. of intermediate features is their hybrid. Between R. lessonae and R. ridibunda there is ecological isolation: the first form lives in small water bodies and hibernates on land while the second form lives in lakes and rivers and hibernates in water. There is no genetic isolation between them which lead to their hybridazition in water bodies situated along the rivers and lakes. The distribution of these three forms in Poland, East Germany, Austria and Switzerland is much better known than in the rest of Europe.

Rana esculenta reproduces, as a rule, hybridogenetically. This means that the hybrid frog discards the entire set of chromosomes received from one of the parental species during meiosis. In mixed lessonae/esculenta population (L-E system) the individuals of the esculenta phenotype produce the gametes which contain only the entire set of R. ridibunda chromosomes, and in the ridibunda/esculenta populations (R-E system) their gametes contain the entire set of R. lessonae chromosomes. In northern Germany and Poland there are pure R. esculenta populations without the parental forms. These populations consist of 50-80 per cent triploids. According to Dr. Gunther's results one part of their gametes contain the sets of R. ridibunda chromosomes and the second part of R. lessonae. We know very little of their reproduction biology.

In populations which live near Poznań, Poland, the males of all three forms are heterogenous. Inheritance of the phenotype and sex within these populations is consistent with Mendel's rules in F_1 generations only (R. ridibunda x R. lessonae). In all further crosses and generations these features are hereditary according to the hypothesis of hybridogenesis. The exception to this rule is sex inheritance of which consistence with this hypothesis is found only in F_2 and in backcrosses B_1 with the individuals of both parental forms. The males of further generations of esculenta phenotype, as a rule, produces only femles.

The hybrids of esculenta phenotype and especially F_1 progeny of R. ridibunda x R. lessonae crosses, show a very strong tendency to migrate from their native ponds. This is not manifested by individuals of other phenotypes. Therefore, in all new artificial water bodies the esculenta individuals appear first and the frogs of other forms much later.

In natural populations near Poznań, Poland, about 75 percent of esculenta females produce eggs which are strongly differentiated. They are divided into two-, three- or even four-size classes. The causes of this phenomenon are not yet fully explained but we have proved that the individuals which emerge from the largest eggs are triploids. If these eggs are fertilized by lessonae sperm they have RLL genotypes and if by ridibunda sperm they have LRR genotypes. This proves that the larger eggs are diploid gametes of the LR genotype. These triploids have much better biological characteristics than the diploids produced by smaller eggs.

The phenotypic composition of froglets in natural populations in Poland depends on the composition of adults. In mixed lessonae/esculenta populations the metamorphosed froglets belong, most often, to three phenotypes: lessonae, esculenta and ridibunda. The individuals of the first two phenotypes consist of females and males in normal proportion 1:1, while the ridibunda froglets are, as a rule, only females which perish during hibernation under the ice cover. In mixed esculenta/ridibunda populations only the ridibunda froglets appear, but the proportions, females to males, are 1.5 : 1. In pure esculenta and ridibunda populations the progeny belong to ridibunda phenotype but in the first populations the female froglets only appear as a rule, and in the second ones the female and males are in normal proportions 1:1. We have not yet found, in Poland, a pure population of R. lessonae because this form lives always together with R. esculenta.

Capranica, Robert R. (Section of Neurobiology and Behavior, Cornell University, New York). Auditory Processing of Vocal Signals in Anurans.

Anurans are highly vocal animals. Their signal repertoire consists of a small set of distinct calls which play an important role in communication. Of these different sounds the mating call is the most obvious and best documented. In most species this call is made only by males at an appropriate breeding site during the reproductive season. Behavioral studies have verified that a female can

discriminate the calls of males of her own species. These experiments involve release of a receptive female midway between two loudspeakers through which recorded mating calls of various species can be broadcast. For a number of species it has been shown that females will selectively approach and make physical contact with the loudspeaker broadcasting the call of a conspecific male. Thus the mating call acts as a premating isolating mechanism to reduce crossbreeding between sympatric species. Behavioral studies of the male's discriminatory ability have involved an evoked calling paradigm. Males will vocalize in response to acoustic playback of mating calls of other males of their own species. The evoked calling behavior serves to establish a chorus and it may also play a role in maintaining spacing between neighboring males.

Analysis of recorded mating calls indicates that species-signaling involves both temporal and spectral characteristics. By employing synthetic calls, it has been possible to identify the exact features which allow some species to identify their own mating call. The detection of these features resides in major part on the sensitivity of the peripheral auditory system. The external eardrum is sensitive to airborne sound. Vibrations of the eardrum are coupled to the inner ear by means of a columellar middle ear. Within the inner ear are two separate auditory organs, the amphibian papilla and the basilar papilla. Electrophysiological recordings from the auditory nerve fibers which innervate the two organs reveal that the amphibian papilla is sensitive to lower frequency sounds while the basilar papilla is sensitive to higher frequency sounds. Thus the two organs are tuned to disjoint frequency ranges which vary between species and play a vital role in detection of the spectral features in species-specific sounds. Furthermore, not only is this matched sensitivity species-specific, it can also be geographically specific. In cricket frogs (Acris) the signal characteristics of the mating call vary with geographic origin. This is accompanied by a matched variation in the sensitivity of the peripheral auditory system. And a recent finding in Puerto Rican treefrogs (Eleutherodactylus coqui) indicates that there can also be a sexual dimorphism in the tuning of the inner ear. This sexual difference in peripheral auditory sensitivity is related to different features in the male's call which signal each sex separately.

Blankenhorn, H. J. (Zoologisches Institut und Museum der Universitat, Zurich, Switzerland). Reproduction and Mating Behaviour in Rana lessonae - Rana esculenta Mixed Populations.

From the results of Berger's studies on European green frogs in Poland, it is known that Rana esculenta Linnaeus is the hybrid between Rana lessonae Camerano and R. ridibunda Pallas (BERGER 1966-70). When the current study was gegun only R. esculenta had been described for vast parts of Switzerland. In the course of my dissertation studies at the University of Zurich, it was shown that all three types of green frogs, R. esculenta, R. lessonae and R. ridibunda occur in this region (BLANKENHORN, 1970). The natural ratio of the three phenotypes is peculiar. Out of 24 frog populations explored in the course of the work, only 3 were pure ridibunda populations, whereas 21 populations were lessonae-

esculenta mixed populations. Moreover, the ridibunda populations are not only divided geographically from lessonae-esculenta populations, but there is strong evidence, that ridibunda has been introduced between 1950 and 1970 by medical institutes using European ridibunda for Xenopus-tests. The frogs were then released near the city of Zurich.

The emphasis of my communication lies therefore on some causal and functional aspects of breeding behaviour of lessonae-esculenta mixed populations, on the presentation of ethological experiments on reproductive behaviour of R. lessonae and R. esculenta, and on speculations about the adaptivity of this "species-hybrid" system.

Reproduction in a natural lessonae-esculenta population - One population inhabited a gravel pit near Zurich and consisted of an estimated 220 individuals, 147 of which were individually marked. Fifteen to 20 animals were of lessonae phenotype. During the breeding season, the males gather together on a small traditional site in the pond and show increased activity and calling. At the highest intensity, some 100 males are crowded on a few square meters. The females come singly to this arena, copulate, lay their eggs in the center of the arena and leave. The distribution of the males in the arena is not random. In general, esculenta males form the center of the arena and lessonae males are found at the perimeter of the arena. Esculenta males showed a significantly higher proportion of aggressive behaviour than lessonae males, where sexual behaviour dominated. The overall activity diminished from the center to the edge of the arena. The copulation rate in lessonae males was more than twice as high as in esculenta males. A direct correlation between place in the arena, behaviour and breeding success is postulated. Some evidence for pairing preferences, especially for mating type lessonae-lessonae could be shown.
Experimental analysis of the mating behaviour of lessonae and esculenta males - In lessonae-esculenta mixed populations only lessonae-lessonae and lessonae-esculenta pairings give viable offspring, whereas esculenta-esculenta pairings give lethal offspring.

The basis for these experiments were the result of the analysis of both mating success and theoretical considerations which indicated that with a proportion of 1 lessonae individual to 10 esculenta in a population of 220 animals, mating by chance could not result in sufficient offspring of the essential lessonae-lessonae type. The questions to be answered were: 1. Are there intra- and interspecific pairing preferences? 2. Which type-specific activity patterns are correlated with such preferences? The experimental design consisted of all combinations balanced and crossed with the 2 types, lessonae and esculenta, 2 age classes, and 2 sex classes as independent variable. Thirty-six males and 36 females were tested in 3 series in 12 aquaria. The behavioural responses of the males in the presence of a female were recorded by using an ethogramme and taken as the dependent variable. A two-way-analysis of variance showed the following results: 1. Independent of age and type of male in the experiment, the older and larger esculenta and lessonae females were preferred over the younger and smaller ones (A-effect). 2. Independent of age and type of the females in the experiment, lessonae males showed more sexual activity; esculenta males showed more aggressive activity (B-effect). 3. Distinct preferences in form of AB interactions occurred in the following pairings:

young lessonae ♂ x old lessonae ♀
young lessonae ♂ x young lessonae ♀
old lessonae ♂ x old esculenta ♀

4. The following pairings were less frequent than expected (AB interaction):

young lessonae ♂ x old esculenta ♀
old lessonae ♂ x young lessonae ♀
old lessonae ♂ x young esculenta ♀
young esculenta ♂ x young and old lessonae ♀
young esculenta ♂ x young esculenta ♀
old esculenta ♂ x young and old lessonae ♀
old esculenta ♂ x young esculenta ♀

The following conclusions can be drawn: 1. lessonae males are more sexually active than esculenta males, 2. both esculenta and lessonae males prefer females that are larger (older) than themselves, 3. if the females are of the same size, lessonae males prefer females of their own type. These mechanisms play an important role in stabilizing lessonae-esculenta mixed populations.

Discussion: The lessonae-esculenta system - The function and adpative nature of the lessonae-esculenta populations are discussed in light of ecological, ethological, genetic, and faunistic considerations.

Halliday, T. R. (Animal Behavior Research Group, Oxford, England).
The Comparative Reproductive Ethology of European Newts: An Evolutionary Perspective.

An experimental analysis of the causal mechanisms underlying the sexual behaviour of the male Smooth newt Triturus vulgaris suggests that the temporal patterning of his behaviour is the result of an interaction between at least three causal factors, the nature and timing of the female's responses, the male's immediate capacity to produce spermatophores and his oxygen debt. A functional interpretation of male behaviour is that it has evolved so as to maximise opportunities for the transfer of spermatophores to the female in the time available, which is largely constrained by his ability to sustain sexual activity without ascending to the surface for a fresh supply of air, thus losing contact with the female. Other factors which may have been important in the evolution of Triturus sexual behaviour are the opportunities that it provides for each sex to assess the other's quality as a prospective mate and the role that courtship display may play in the prevention of hybrid matings. It is suggested that a number of behavioural and morphological characters of the male may be the result both of sexual selection exerted by the female and of the fact that reproductive isolation appears to be primarily due to female selectivity.

Particular attention is given to the relationship between T. vulgaris and the closely related Palmate newt T. helveticus. It is suggested that a number of behavioural and morphological differences between these species have evolved in association with an ethological isolating mechanism based on female recognition of male display which has evolved secondarily to genetic incompatibilities between these species.

The sexual behaviour patterns of a number of Triturus species are compared. On the basis of this comparison these species can be divided into three subgeneric groups which show a close concordance with taxonomic relationships based on morphological characters and on known genetic affinities.

Comparison of Triturus sexual behaviour with that of the closely related genera Notopthalmus, Taricha and Cynops suggests that Triturus represents the extreme expression of a trend towards increased female freedom of movement during sexual behaviour. A parallel trend has occurred in a number of animal groups, including, among the Urodeles, the Ambystomatids and the Plethodontids.

Houck, Lynn D. (Museum of Vertebrate Zoology and Department of Zoology, University of California, Berkeley). Reproductive Biology of Neotropical Salamanders.

Neotropical salamanders, originally thought to be a monogeneric group of low profile, actually are highly diverse and abundant. Nearly one-half of all living salamander species occur in the neotropics. All are pletohdontids and all have terrestrial eggs which develop directly into the adult form. This paper considers the reproductive patterns of neotropical salamanders found in a variety of habitats and elevations, and compares these patterns with those of temperate zone plethodontids having direct development.

The overall reproductive pattern observed in most neotropical species is generally similar to that of temperate plethodontids. Reproductive variables which are similar in tropical and temperate species include: (1) Age at first reproduction is approximately $2\frac{1}{2}$ - $4\frac{1}{2}$ yrs., depending on adult size. (2) Females are larger (and thought to be older) than males at first reproduction. (3) Average adult size is larger in females than in males (although most extreme cases of sexual dimorphism occur in neotropical species). (4) Growth rate of juveniles is roughly 15 mm/yr. (5) Females oviposit biennially in all areas where surface activity is restricted during many months of the year. (6) Clutch volume is roughly comparable for females of similar size. (7) There is a positive and statistically significant correlation between standard length and clutch size. (8) For females of a given standard length, variation in clutch size is high. (9) The sex ration is 1:1 (see below for one exception).

There are also substantial differences in reproduction between neotropical and temperate salamanders: (1) Aseasonal oviposition (and its ramifications) has been documented for three neotropical species. Such aseasonality is extremely rare, and has never been observed for extra-tropical salamanders. (2) Spermatogenesis, the development of male secondary sexual characters, and courtship activities all are aseasonal in each neotropical species examined to date. Once males become sexually mature, they produce viable sperm and are phsyiologically prepared to court at any time of the year. Temperate salamanders have definite cycles of spermatogenesis and courtship. (3) Clutch size in many species of Bolitoglossa is 2-3 times that of similarly-sized temperate plethodontids. Egg size in these Bolitoglossa species is relatively smaller. (4) Neotropical females brood egg clutches for about 4-6 months, compared with 2-3 months for North American females. (5) Females in the eastern U. S.

brood eggs during wet summer months when other salamanders are active. Females in the western U. S. and the neotropics brood eggs during dry season months when surface activity is restricted for all salamanders. (6) The sex ratio in Chiropterotriton bromeliacia (a small, arboreal, neotropical species) apparently is 3o :1o.

Salamanders in any area primarily are constrained by local moisture and temperature regimes. Overall climatic patterns govern activity cycles and therefore growth rates and optimal timing of oviposition. Within broadly similiar patterns of activity, a comparison between neotropical and temperate plethodontids reveals striking differences in clutch size, egg size, seasonality of spermatogenesis and courtship, and length of time spent brooding eggs. These variables provide a measure of flexibility in life history patterns and probably allow the "fine-tuning" necessary for optimal adaptation to local conditions.

Kawamura, Toshijiro and Midori Nishioka. (Laboratory for Amphibian Biology, Hiroshima University, Japan). Aspects of the Reproductive Biology of Japanese Ampbhibians.

In the four main islands of Japan and the Island of Tsushima situated between Japan and Korea, sixteen anuran and about fifteen urodelan species are found. Of the anuran species, Rana nigromaculata and R. brevipoda are pond frogs allied to Rana esculenta. Six other species, Rana japonica, ornativentris, tagoi, chensinensis, tsushimensis and dybowskii, are brown frogs allied to Rana temporaria, although Rana tagoi differs from the others in many respects. In addition to these species, two, small, dark-colored frogs Rana rugosa and R. limnocharis and a large American frog Rana catesbeiana are widely distributed. Species belonging to genera other than Rana are: Hyla arborea japonica, Bufo bufo japonicus and three species Rhacophorus. While it is generally believed that Bombina orientalis is distributed in the Island of Tsushima, it has not been recently found on this past island. In the past ten years, Kawamura and his collaborators have studied various problems relating closely to the reproductive biology by making use of most of the Japanese anuran species and some foreign ones. An outline of the results obtained by us will be reported here.

1. The sex of gynogenetic diploids. Gynogenetic diploids were produced in six species, Rana nigromaculata, Rana brevipoda, Rana japonica, Rana rugosa, Hyla arborea japonica and Korean Bombina orientalis. In these species, the sex is completely differentiated at the stage immediately after metamorphosis. While the former four species are of a semi-differentiated type, the other two are gonochorists. If the male is heterozygous (XY) in sex-determining mechanism, all the gynogenetic frogs are genetically females (XX), as their diploidy is established by fusion of the two haploid nuclei produced by the second maturation division. If all the gynogenetic frogs are females, it is inversely presumed that the male of this species is heterozygous. As the result of experiments, it was found that a few males are always produced together with a great many females in the four Rana species. The males are genetic females whose sex was reversed. Such sex-reversed males are more numerous in brown frogs than in pond frogs. In an exceptional case, all the gynogenetic diploids produced from a female Rana nigromaculata were males. In Hyla and Bombina, sex reversal does not seem to occur; all the gynogenetic diploids are females.

2. Effects of sex hormones. The fact that the sex reversal of genetic females into males occurs by administration of androgen, and that nearly all the offspring of sex-reversal occurs from males into females by administrationof estrogen in Hyla arborea japonica. In Bombina orientalis, no sex reversal occurs by administration of androgen or estrogen.

3. YY males in the field. If the male is heterozygous (XY) in the Japanese tree-frog, YY males as well as sex-reversed females should be found out in the field, since sex reversal occurs from males into females in this species. Three of 14 male albinos collected from the field in the past ten years were actually those that were considered to be YY in sex-determining mechanism. Moreover, a female used in the control of an experiment was presumed to be XY.

4. The sex of haploids and polyploids. The sex of 18 haploid frogs and metamorphosing tadpoles of Rana nigromaculata has been reported by Miyada (1960). While 14 of them were females, one was hermaphroditic and the remaining three were males. Many haploid frogs can easily be produced by pseudo-fertilization in Rana rugosa. Within one month after metamorphosis, most of the haploid frogs in Rana nigromaculata and Rana japonica were repeatedly reported by Kawamura and his collaborators. In Rana rugosa, all the triploids become males within one month after metamorphosis. No sex-reversal occurs in triploid Bombina orientalis. The sex and reproductive capacity of auto- and allotetraploids frogs have been reported by us (1960, 1963, 1967).

5. Interspecific hybrids. Many kinds of crosses have been made among Japanese, Korean, Formosan and European allied species of pond frogs as well as of brown frogs, by Kawamura and his collaborators. In pond frogs, nine species and subspecies are completely or incompletely isolated from one another by hybrid inviability of hybrid sterility. Eight species of brown frogs are completely isolated from one another by gametic isolation, hybrid inviability or hybrid sterility; mature hybrids are all sterile males.

6. Effects of irradiation. First-generation offspring were produced from spermatozoa or uterian eggs irradiated with X-rays (90 - 250 rads) or neutrons (50 - 250 rads) by fertilizing with untreated gametes in Rana nigromaculata and R. japonica. From males and females of the first-generation offspring, second-generation offspring were produced by mating with frogs collected from the field. Third- and fourth-generation offspring were produced in turn by the same procedure. In all four generations, sex reversal of females into males occurs frequently. Beside these experiments, second- and third-generation offspring were produced from female first-generation offspring by applying the method of diploid gynogenesis in Rana nigromaculata. Although all these offspring are genetically females (XX), sex-reversed males always appear in a high percentage in each experimental series. Sex reversal occurs far more frequently in the series of frogs derived from gametes irradiated with X-rays than that in the series from gametes irradiated with neutrons.

Littlejohn, M. J. (Department of Zoology, University of Melbourne, Parkville, Victoria, Australia). Divergence, Convergence and Stability in Anuran Acoustic Signaling Systems Concerned with Reproduction.

An evolutionary approach will be adopted and the selective forces moulding the structure and function of the anuran acoustic communication system examined with respect to: species-specific mating systems, male territoriality, and identification of sex and reproductive state.

In particular, the following aspects will be considered:

1. Constraints on the evolution of such systems including the properties of the atmosphere as a communication channel, morphology and physiology of emitter and receiver, degree of channel utilization, requirements for directionality and range, and evolutionary history.

2. Divergence, mainly in the male mating call-conspecific female response system, with regard to the significance of reproductive character displacement, differences in acoustic environments, sexual selection, and drift/founder effects.

3. Selective components leading to convergence of acoustic signals and associated adaptive responses including interspecific territoriality, post-interactive allopatric release, mimicry, introgressive hybridisation and optimisation of systems for maximal efficiency, directionality and range.

4. Degree of geographic stability in mating-call structure in wide-ranging taxa with respect to the importance of genetic canalisation, gene-flow and uniformity of selective regimes.

5. Intraspecific variability due to differences in temperature and body dimensions (ontogenetic and selected).

An integrated approach to the evolution of systems of acoustic communication will be attempted at intraspecific, interspecific and community levels, by considering: allopatric, parapatric, hybridising and sympatric populations of wide-ranging species complexes, and multi-species breeding aggregations. Examples will be drawn from the anuran faunas of southern Australia and North America, with a review of progress over the last 25 years in the utilisation of objective descriptive, experimental and comparative techniques in the study of sound communication.

Finally, the contributions of acoustic studies on anurans to the understanding of the origins, evolution and maintenance of selective mating systems (premating reproductive isolation), and the partitioning of reproductive resources, as critical aspects of vertebrate speciation, will be assessed.

Mancino, Giorgio. (Instituto di Zoologia dell Universita, Pisa, Italy). Cytotaxonomic and Cytogenetic Investigations in European Newt Species.

The European salamandrids share an equal chromosome number (n = 12, 2n = 24) and mitotic karyotypes of largely uniform size and morphology - all being symmetrical and unimodal. The differences sometimes noted in the morphology of the mitotic chromosomes are not so prominent as to allow deductions about the mechanisms involved in the process of speciation and karyological evolution.

On the other hand, a detailed study of giant lampbrush chromosomes of a number of salamandrid species has revealed that the karyotypic uniformity assumed by several authors to occur in the family Salamandridae is somewhat illusory. Each species so far examined has lampbrush chromosomes characterized by landmarks which can differ from each other in number, morophology, texture and position along the chromosomes. The differences are likely due not to large-scale scale structural rear rangements (such as large inversions and translocations), but to evolutionary changes in single genetic loci. Therefore, it is impossible to define these Urodele species complexes as "homosequential". Further evidence from in situ hybridization techniques tend to indicate that, as far as 28S + 18S and 5S rRNA genes are concerned, even closely related newt species exhibit a rate of great variation of the pattern of gene localization. A wider use of the in situ hybridization technique can lead to a better knowledge of the gene distribution at the chromosomal level.

At present, evidence obtained by the use of the C-staining method for a differential banding pattern of specific regions of both mitotic and lampbrush chromosomes has appeared as a suitable means for cytotaxonomic and cytogenetic studies. To this end, interspecific Triturus hybrids have been revealed as an appropriate biological system: in fact, the most reliable chromosomal analyses are those where two different specific genomes are examined in the same hybrid individuals, providing definitive information on chromosomal homologies and genetic similarity between the parental species.

Nickerson, Max A. (Milwaukee Public Museum, Wisconsin). Reproductive Biology of Paedogenic Salamanders.

No Abstract Received.

Schneider, Hans. (Zoological Institute, University of Bonn, Germany). Auditory Behavior and Physiology of Vocalization in the European Tree Frog, Hyla arborea (L.)

In Southern Germany the calling period of the tree frog Hyla arborea arborea (L.) begins in the first days of May and usually continues into the first half of July. The males begin calling at consistent times in the evening; calling activity lasts until about midnight, unless the air temperature falls below the threshold of 8°C. Mating calls are usually given in series of 15-30 calls. With few exceptions each call comprises nine pulses; the amplitudes of successive pulses gradually rise to a maximum and then decline relatively rapidly. The tree frog's repertoire includes a number of calls in addition to the mating call: the territorial call, male release call and distress call. As temperature rises there is a systematic decrease in duration of the mating call and of the intervals between calls. The other European tree frogs also give mating calls with very distinctive characteristics. Knowledge of the details of the different mating calls and the influence of temperature upon them provides a useful criterion for evaluating the systematic status of the European tree frogs.

The sound-producing apparatus of the tree frog consists of the laryngeal skeleton together with the vocal cords and four pairs of muscles. The tree frog has the largest larynx, with respect to its body size, of all European anurans. In the female the larynx is only one-third, or at most half, as large as in the male. Electron-microscopic examination has shown that the fine structure of all the larynx muscles of male tree frogs is the same and identifies them as very fast muscles; the muscle fibers are very thin, the sarcoplasmic reticulum is massively developed, the mitochondria and the motor endplates are very numerous, and the larynx muscles contain a great deal of fat. The physiological properties revealed by experiments with electrical stimuli are also significant. At 6°C 30-50 stimuli per second suffice to put the muscle into smooth tetanus, whereas at 24°C 240-260 stimuli per second are required. The larynx muscles of the females are much slower, since a smooth tetanus is produced by 30 stimuli per second at 10°C, and by 80 stimuli per second at 20°C.

Histological studies of Hyla a. arborea have resulted in an atlas of the brain based on a stereotaxic system which permits localization of each point in the brain and identification in terms of its coordinates. Extensive experiments in which the brain of Hyla arborea savignyi Audouin was stimulated electrically have shown that the preoptic region of the diencephalon is extremely important in central-nervous control of sound production. Stimuli applied in this region elicit prolonged calling activity. The electrically elicited mating calls in some respects differ only slightly from natural mating calls.

Tilley, Stephen G. (Department of Biology, Smith College, Massachusetts). Reproductive Ecology of North American Plethodontids.

The literature on life histories of North American plethodontid salamanders has been expanding in recent years. This owes largely to an expanding interest in all aspects of the biology of these animals, and in the study of life histories and their adaptive natures. The relative ease of obtaining large series of many plethodontid species, and the ease with which these series yield data pertinent to the study of life histories and reproductive ecologies, make plethodontids attractive organisms for such studies.

Consideration of the state of our knowledge of North American plethodontid life histories is facilitated by first enumerating some of the goals of life history studies. We can then evaluate current methods of obtaining, analyzing, and interpreting data in the light of these goals. Most life history studies seem to be driven by at least one of the following:

1. Interest in clarifying the life history of a particular organism. Investigators who find themselves unstimulated by the socio-economic or agricultural importance of organisms may find themselves attracted to plethodontid salamanders, which combine obsecurity, beauty, and abundance in unique ways.

2. Interest in the phenomenon of adaptation. The adaptive nature of many phenotypic characters is obscure because correlations with Darwinian fitnesses are usually obscure. This is not generally

true of life history studies, which attempt to measure components of fitness directly and interpret them as adaptive strategies.

3. Interest in the importance of plethodontid populations as components of the ecosystem they inhabit. Plethodontids are often among the most abudnant vertebrates of terrestrial communities. This may reflect their importance as movers of energy and nutrients, or regulators of their predators or prey.

4. Interest in the implications of reproductive and life history patterns for the genetic structure and differentiation of populations.

These implications seem to have largely escaped attention, but will assume importance as techniques for quantifying levels of genetic variation and divergence continue to be assimilated by population biologists.

Studies of reproductive patterns and life histories of plethodontids are still largely at a descriptive level, but we can inquire whether the data currently being generated can be usefully applied to any but the first of the above goals. In fact, most studies suffer from a number of weaknesses.

Hopes of applying studies of plethodontids to understanding adaptation and ecosystem function are hampered by difficulties in obtaining data on three parameters: age-specific survivorship, age-specific fertility, and age at first reproduction. Such data are critical to understanding the adaptive nature of life histories and the productivity of populations. The limitations of most studies stem from their reliance on serial, "vertical" sampling of populations, rather than on long-term, capture-recapture studies that yield more direct estimates of critical parameters. Few plethodontid populations lend themselves to capture-recapture studies, and few biologists seem willing to invest more than a few years (or more than the usual time required to produce a dissertation) in the study of a single population or species. This leads to estimating age from testis lobation, survivorship curves from age structure, age at maturity from juvenile body size distributions, and oogenic cycles from distributions of ovarian follicle sizes in chronological samples. In some cases these estimates may be sufficiently accurate for first approximations, but important phenomena may be obscured. An example is our tendency to interpret follicle size data in terms of annual vs. biennial oogenic cycles, ignoring the possibility that individual animals may not fit either. An additional problem is that when life history data are available, they are often interpreted as reflecting "r-selection" or K-selection," or some combination thereof. Any life history can be positioned somewhere on the "r-K continuum," but thus positioned it is not necessarily explained or sufficiently interpreted from an evolutionary point of view.

Long-term studies of two populations of Desmognathus ochrophaeus illustrate the application of capture-recapture methods of plethodontid populations that do happen to lend themselves to these techniques. These studies elucidate features of this species' life history and population biology that have previously been investigated much more indirectly, such as the relationship between age and testis structure, variation in age at maturity among popu-

lations, and details of the oogenic cycle. It is also possible to compare the turnover of young and old males in populations, and this lends to speculation on the significance of competition among males for opportunities to inseminate females. Discussions in this area will be speculative until information is available relating ages of males to numbers of spermatophores produced, numbers of sperm per spermatophore, probability of success in courtship, and probability of emigration or successful migration to a new population. Such information bears heavily on understanding the effective breeding sizes of populations, levels of genetic variation they can support, and levels of genetic isolation among them, and illustrates the bearing of reproductive studies on our understanding of evolution within a species.

Wake, Marvalee H. (Department of Zoology and Museum of Vertebrate Zoology, University of California, Berkeley). The Reproductive Biology of Caecilians.

The reproductive biology of caecilians (Amphibia: Gymnophiona) is reviewed and new data are provided. Caecilian reproduction differs considerably from that of other amphibians. Fertilization in all species is internal, and effected by a male intromittent organ which is the everted posterior part of the cloaca. Little is known of courtship or mate selection and recongition.

A number of caecilian species are live-bearers, in contrast to the very few species of anurans and of urodeles. Some members of the Caeciliidae and probably all members of the Scolecomorphidae and Typhlonectidae are viviparous. Most live-bearing species are lowland, ranging from sea level to 2500 m. Clutch size and ovum size are reduced in these species relative to egg-layers. Developing young are retained in the oviducts through metamorphosis. One to twelve young may be born. The yolk supply is exhausted relatively early in development, and the fetuses feed on material secreted by the oviducal epithelium. Fetuses have a morphologically species-specific dentition that appears to be used to scrape the oviducal lining, stimulating secretory activity. The fetal dentition is lost just before or very shortly after birth and the adult dentition quickly erupts. The thin, highly vascularized skin and the gills (paired and triramous in caeciliids and scholecomorphids, paired and sacciform in typhlonectids) are appressed to the oviducal wall and probably function in gaseous exchange. Gills are resorbed before birth. Typhlonectid young are born in fresh water, fully able to swim and to breathe air.

Several species (all ichthyophiids, by definition, and some caeciliids) are terrestrial egg-layers. The clutch is laid in a burrow or under ground cover near a stream, and maternal brooding has been noted for several species. Larvae hatch from the eggs and wriggle to the stream. Larvae have triramous gills, a lateral line system, and an adult-type dentition.

Reproduction in most caecilian species appears to be cyclic. The spermatogenic cycle is documented only for Gymnopis multiplicata, but evidence indicates that many species have a similar pattern.

The male Mullerian ducts remain functional, correlated with spermatogenic activity. The posterior portion of each duct becomes glandular during the period of spermatogenesis, and subsequently regresses. It is hypothesized that the secretion provides a fluid vehicle for sperm transport in a terrestrially evolved internal fertilization system.

In species for which adequate samples are available, ova in all mature females are at the same vitellogenic stages, suggesting seasonal reproduction. The fully yolked ova of certain egg-laying species are among the largest in amphibians, measuring 10 x 7 mm. Evidence for one viviparous species (Geotrypetes seraphini) indicates that age at first reproduction may be two years. Data suggest that gametogenic activity in both sexes of several species occurs each year, though the interval may be greater for females of some species. Birth of young in several terrestrial species occurs at the inception of the rainy season, suggesting that reproduction is seasonally correlated with moisture and food optima. However, larvae at various stages of development occur at certain sites throughout the year, indicating that some lowland egg-laying species may be acyclic.

Wells, Kentwood, D. (Smithsonian Tropical Research Institute, Canal Zone). The Evolution of Courtship Behavior in Frogs.

Anuran courtship includes long range and short range courtship. Long range courtship usually involves production of acoustic signals that are broadcast at large by males and are not directed at particular individuals. Short range courtship involves signals directed at particular individuals. Most male frogs have advertisement calls that attract females and sometimes serve other functions such as territorial advertisement. Males in large choruses must compete with other calling males for the attention of females. Males may increase their chances of obtaining mates by 1) alternating calls with neighboring males, thus reducing acoustic interference; 2) changing the temporal pattern of calling as male densities change; 3) producing more complex calls as male densities increase; 4) parasitizing other calling males; or 5) abandoning acoustic signaling and switching to an active search stragegy. Similar behavioral strategies are employed by many acoustical insects.

Short range courtship usually involves changes in call rate or call intensity in response to approaching individuals, production of special courtship calls, or the use of tactile and/or visual signals. These signals may provide more directional information to females at close range and enable them to find individual males more easily. Short range courtship calls are often softer than advertisement calls, perhaps enabling a male to attract nearby females without eliciting similar courtship calls from competing males. Short range courtship signals may be particularly advantageous in situations where vocal competition among males is intense.

Complex courtship involving exchange of signals between males and females at close range is relatively rare in frogs. Such behavior has been reported in the midwife toad, some leptodactylids, and

many pipids and dendrobatids, and it may occur in other species as well. Females of some species respond to male calls with calls of their own. Tactile interactions are important in pipids and dendrobatids, and visual cues seem to be very important in dendrobatids, all of which are diurnal. Dendrobatid courtship often includes elaborate postural displays, rubbing and other tactile signals, circling of one partner by the other, and leading of one frog by the other to the oviposition site.

Complex courtship often occurs in species with prolonged breeding periods in which males and females live together in the same habitat for much of the year. Males encounter both receptive and non-receptive females, and complex courtship may be important in enabling a male to determine the willingness of each female to mate. Furthermore, in some species, females may require repeated courtship attempts by males before they will mate, and sexual selection may favor prolonged or elaborate courtship by males. When both sexes are territorial, as in some dendrobatids, complex courtship may be important in enabling one sex to overcome the aggressive responses of the other sex to territorial intruders. A partial reversal of the usual sex roles in courtship, with females taking the more active part, may have occurred in some dendrobatids in which males assume the primary role in parental care. The relationship between parental investment and courtship behavior needs to be investigated in more detail.

CONTRIBUTED PAPERS

Auburn, Jill Shore and Douglas H. Taylor. (Miami University). Orientation by Means of Polarized Light in bullfrog tadpoles, Rana catesbeiana.

Bullfrog tadpoles trained indoors in tanks with plane-polarized light projected onto the shoreline oriented predictably when tested indoors in a circular arena illuminated by polarized light. Rotation of the plane of polarization in the test arena resulted in a similar rotation of the angle of orientation, demonstrating that these animals can perceive plane-polarized light. Tadpoles trained in outdoor tanks with gravel shorelines oriented predictably when tested outdoors at sundown when the sun was below the horizon and only clear blue sky was visible. Polarized light, which is prevalent in clear blue sky, especially at sunrise and sunset, is implicated as a cue in this response. Experiments are currently being performed, both outdoors under the natural sky and indoors under artificially polarized light, to investigate the use of plane-polarized light in amphibian orientation.

Berger, Thomas J. (University of Missouri) and James L. Vial (University of Tulsa). The Influence of Light Upon Activity Rhythms of Five Syntopic Species of Tadpoles

Environmental communities demonstrate an inexorable pattern of rhythmicity. Diel activity patterns are known to be influenced by a number of physical factors; among the most conspicuous is light. Many species of anuran larvae occur syntopically and

demonstrate similar ecological requirements. To determine the possible role of light in modulating circadian rhythms among tadpoles, the activity patterns of five species of syntopic larvae (Rana catesbeiana, R. pipiens, R. clamitans, Pseudacris triseriata, and Bufo americanus) were studied under exposures of alternating light-dark (LD 14:10), continuous light (LL), and continuous darkness (DD). The data obtained in this research suggest that larvae of four species (R. catesbeiana, R. pipiens, R. clamitans, and P. triseriata) may lessen the interspecific competitive pressures as a result of light-cued temporal differences in their diel activity rhythms. A fifth species (B. americanus) may use the presence or absence of light in conjunction with other biotic and abiotic factors for cueing and maintaining rhythms during its larval period.

Bogart, James P. (University of Guelph). Ethology, karyology and taxonomic position of the South American leptodactylid frog genus Edalorhina.

Information obtained from a population of Edalorhina perezi from amazonian Peru indicated that E. buckleyi is a synonym of E. perezi. Comparisons were made between E. perezi, representatives of the four species groups of Physalaemus, Lithodytes lineatus, and Pleurodema. The results indicated that Edalorhina is most similar to some species of Physalaemus and should be included as a fifth species group in that genus.

Briggs, Jeffrey. (University of Wisconsin). Breeding Biology of the Cascade Frog, Rana cascadae.

The breeding behavior of Rana cascadae was observed from 1966 through 1970 in the Cascade Mountains of Jefferson County, Oregon. The frogs overwinter in the mud in the bottom of ponds or surrounding spring saturated ground. Breeding activity begins with the emergence of the males as soon as the ice begins to melt in the breeding ponds. Males call from dead, floating vegetation and from a floating or swimming position in open water. One male was observed calling under water. Three call types are analysed. 1. Series clucks - average duration = 0.0587 s. 2. Double clucks - duration = 0.0480 s. 3. Mew call - duration = 0.292 s. Release calls were heard but not recorded. Amplexus is axillary and more than one male (up to 5 observed) may clasp a female at once. The eggs are deposited in water less than 7 cm deep and usually at traditional sites at the waters edge. Many egg masses at the site fuse into a single large mass with the jelly swelling to protrude from the surface of the water. Breeding biology is most similar to Rana pretiosa of the Pacific Northwest Rana complex.

Cadle, John E. (University of Georgia). Species Diversity of Stream Salamanders on Two Southern Appalachian Watersheds with Contrasting Vegetation Types.

The relative abundances and species diversities of stream salamanders were compared between two watersheds, one covered by a natural hardwood forest, the other by a pine monoculture. Species diversities were not significantly different on the two watersheds. The species compositions of the two salamander communities, however, were different. Desmognathus ochrophaeus was the most abundant stream salamander on the hardwood watershed, while D. monticola, D. ochrophaeus, and D. fuscus were more nearly equally abundant on the pine watershed. These differences are interpreted to be indirect effects of vegetation ocer on the two salamander communities.

Caldwell, Ronald S. and George W. Folkerts. (Auburn University). Variation and Systematics of the Desmognathus monticola complex

Desmognathus monticola ranges widely, occurring from Florida, north to Pennsylvania. A number of the populations are disjunct. Desmognathus welteri may be a member of the D. monticola complex, since it resembles D. monticola in many respects. Further work is needed to clarify the status of D. welteri. The past migrational patterns have complicated variation in this species and circular overlap may exist. The subspecies D. monticola jeffersoni is weakly differentiated for adjacent populations of D. m. monticola, and several other populations of monticola are qually distinct. Some problems have been encountered in the past because workers were unable to separate D. monticola from D. fuscus.

Carpenter, Charles C. (University of Oklahoma). Chameleons of Madagascar: (A motion picture film by the late Dr. Stephen R. Parcher).

Case, Susan M. (University of California). Biochemical Systematics of Rana in Western North America.

Electrophoretic and immunological techniques have been used to reassess the evolutionary relationships among species of Rana native to western North America. Data indicate that R. aurora, R. boylei, R. cascadae, R. muscosa, and R. pretiosa are closely related and form a separate lineage allied more closely with the Eurasian R. temporaria than with other North American ranids. Rana tarahumarae, previously thought to be allied with R. boylei and R. muscosa, is not related to these two species. It is part of a Mexican radiation derived from an early off-shoot of a pipiens stock.

Casebere, Debra C. and Douglas H. Taylor. (Miami University). Life History Phrenomena in the American Toad, Bufo americanus.

The ontogeny of tadpole orientation behavior and its relation to a possible disassortative mating system in the american toad was investigated. Approximately 15,000 toad eggs were placed along a selected shoreline in an enclosed pond. Upon hatching, weekly orientation tests were performed in an outdoor arena. The development of orientation abilities in the tadpoles was related to possible life history consequences.

Clark, Brian D. (University of Michigan). Analysis of Aerial Locomotion of 4 Ptychozoon lionatum was studied by cinematography. In flight the limbs are outstretched. Patagium extenion is correlationed with a marked dorso-ventral compression of the grunk while air resistance serves to tense the outstretched membrane. Take offsfrom a hoizontal surface were usually close to horizontal, but diving take offs followed by slight horizontal flairing were frequently observed. A constant velocity with the body more or less horizontal was usually attained after a 3 m height loss. At constant velocities, the path of descent ranged from 40° to 90° below horizontal and was determined by the magnitude of the horizontal velocity gained in flairing out of dives) and terminal vertical velocity. Terminal vertical velocity can be predicted from standard equations for parasite drag (profile drag). The coefficient of parasite drag, which depends primarily on the shape of the body, was approximately 1.1. In steady flight, the anatomical and behavioral specializations for aerial locomotion in Ptychozoon lionatum create high drag forces which serve only to retard descent as in man-made parachutes. This distinguishes Ptychozoon from gliding lizards, such as Draco, and probably from the gliding mammals, all of which create lift forces with essentially the same morphological traits seen in Ptychozoon.

Crump, Martha L. and Stanley N. Salthe. (Brooklyn College of City University of New York). Natural Selection and Anuran Locomotion.

The intrinsic variability of traits proposed by previous authors as being important in frog locomotion was compared with the intrinsic variability of other hindlimb traits and was found to be significantly less variable. This is taken to signify more intense selection upon the former. In a nonjumper, Atelopus, the ratio femur/tibfib is not less variable than other hindlimb traits as it is in a jumber (Acris). A new ratio (foot/tibfib) is suggested as being of importance in both styles of locomotion. The ratio tarsus length/snout-vent length is suggested as being primarily under the influence of genetic drift in Atelopus. Clinal variability as noted by other authors in Acris is corroborated.

Cushman, Janette R. and Gary C. Packard. (Colorado State University). Concentrations of Lactic Acid in Neotenic and Transformed Tiger Salamanders (Ambystoma Tigrinum) Before and After Activity.

Concentrations of lactic acid in bodies of inactive neotenic tiger salamanders were similar to those recorded for inactive transformed animals. Transformed salamanders swimming against a water current for 5 min accumulated significantly mor lactic acid in their body fluids than did neotenic salamanders, but subsequently metabolized the lactate at higher rates than characterized neotenic animals. Total body lactate in both morphs decreased rapidly in the first 1½ hrs after activity, and within 6 hrs had returned to the level (common to both morphs) observed prior to activity.

Dalrymple, G. H. (Ohio State University). Durophagic Adaptations of Dracaena guianensis.

Modifications of the jaw mechanism of the caiman lizard, Dracaena guianensis (family Teiidae), for durophagy (feeding upon hard-shelled foods) are described on the basis of comparisons with its close relative Tupinambis. Adaptive interpretations of skull modifications can be posed in terms of enlargement of sites for jaw muscle attachments and strengthening of the palatal architecture for the crushing mode of feeding. The distinctively flared quadrate allows for enlargement of the Add. mand. externus muscle, resulting in improvement of the mechanical advantage of the muscle as well as reinforcement of the jaw articulation. Study of the dentition in relation to size reveals that enlarged and flattened teeth are present even in smaller lizards and are not the result of ontogenetic alteration as in Varanus niloticus. The state of the constrictor dorsalis muscles and the intracranial joints indicate that cranial kinetic motions may occur during feeding. These findings necessitate re-evaluation of theories of the adaptive significance of cranial kinesis in lizards.

Danstedt, Rudolph T. (University of Maryland). Local Geographic Variation in Demographic Parameters and Body Size of Desmognathus fuscus (Amphibia: Plethodontidae).

Life history and related demographic parameters are compared among six Maryland populations of the dusky salamander, Desmognathus fuscus. Major life history features are similar in all populations. Females lay eggs every year, with oviposition taking place in summer. Larvae transform at 9-12 mo of age. Males mature at 2 yr of age, females at 3 yr. Survival rates (determined from age structure and sex ratio) differ considerably among the populations, with these differences being greater for males and older animals than for females and juveniles, respectively. There is also substantial interlocality variation in body size and reproductive rate. Body size and adult survival are negatively correlated, but body size and juvenile survival are not statistically related. Reproductive rate is greater in populations where adult survival is lower. Part of these fecundity differences can be attributed to body size differences. Populations in the same physiographic province are the most similar, but not consistent geographic trends are present. Evidence is scant as to the cause(s) of the observed variation. The study suggests that a complte understanding of the magnitude and nature of broad geographic demographic trends may necessitate a consideration of local variation.

DeRosa C. T. and D. H. Taylor. (Miami University). A Comparative Study of Homeward Orienting Ability in Three Species of Turtles: Chrysemys picta, Terrapene c. carolina, and Trionyx spiniferus.

Homeward orientation of three species of turtles (C. picta, T. c. carolina and T. spiniferus) was determined following capture, displacement and release in a circular terrestial test arena. For all three species a significant orientation in the homeward direction was found. When these same animals were subjected to a phase delay of six hours, both C. picta and T. c. carolina shifted their direction of orientation 90° clockwise. This indicates the use of the sun or some other time dependent mechanism, in conjunction with an internal biological clock, for the purpose of homeward orientation.

Devine, Michael C. (University of Michigan). Species Discrimination in Mate Selection by Free-Living Male Garter Snakes and Experimental Evidence For the Role of Pheromones.

Individual male garter snakes of two species (Thamnophis sirtalis and T. butleri) were located in the field and presented with females of both species and experimentally treated females. Males invariably courted only conspecific females unless treatment was applied. Significant numbers of males of both species courted females of the alternative species which had been coated with a solution derived from females conspecific to the males involved. Evidently, species-specific chemical cues are important as releasers of male courtship and, consequently, they can have the effect of reproductive isolating mechanisms. The precision of discrimination by Thamnophis males compared to certain lizards is viewed as a function of differences in the mating systems of the two groups.

Dodd, C. Kenneth, Jr. (National Museum of Natural History) and Edmund D. Brodie, Jr. (Adelphi University). Antipredator Mechanisms of Neotropical Salamanders.

Antipredator mechanisms, including immobility, various postures, flipping, noxious secretions, tail autotomy, and cryptic and aposematic coloration, of 19 species of neotropical salamanders were studied during the summers of 1973 and 1975. Between 65% and 100% of individuals of each species became immobile when contacted in the field. Defensive postures generally fell into 8 categories: Body arched, body elevated, body coiled, limbs extended, limbs clasped, tail arched, tail elevated, and tail undulated. Flipping fell into 3 categories: coil-uncoil (Central American Chiropterotriton, Oedipina), running (Mexican Chiropterotriton, Bolitoglossa, Pseudoeurycea), and serpentine (only O. uniformis). Secretions were observed in most species and the secretions of P. smithi and B. resplendens proved noxious when tasted. Predator reaction to B. subpalmata and C. multidentatus confirmed that salamanders do posture and/or flip to escape predation. The importance and interrelationships of immobility, postures, noxiousness, and coloration will be discussed.

Douglass, John F. (University of South Florida). Patterns of mate-seeking and burrow use in a southern Florida population of Gopherus polyphemus.

Observations on courtship and combat were made during a long-term mark-and-release study of a population of Gopherus polyphemus at Archbold Biological Station in Highlands County, Florida. Dominant males maintained burrows of their own and visited as many as four different females at separate burrows during spring, summer, and fall. Courtship occurred at these burrows, where males head-bobbed into the entrances and awaited the emergence of female occupants. As many as three different males visited the same female in a single season, and males tended to vist the same female from year to year despite changes in the locations of preferred burrows. Defense of burrows by both males and females was observed, and fighting between males occurred over access to females and their burrows. Large males, by assertion of their dominance whenever other males were encountered, maintained spatiotemporal territories within which where were opportunities to breed with particular females. Patrolling and maintenance of harems by males was impeded by their slowness of movement relative to the dispersion of the females they visited, and subordinate males sometimes mated with preferred females in the absence of dominant males. (Research supported by Archbold Expeditions of The American Museum of Natural History).

Echternacht, Arthur C. (University of Tennessee). The Ameiva (Sauria, Teiidae) of Trans-Andean South America: Trends in Geographic Variation and a New Species.

Six species of Ameiva are known or expected to occur in trans-Andean South America: bridgesi, edracantha, festiva, leptophrys, orcesi and septemlineata. To these may be added an undescribed species from Colombia. With the exception of edracantha, all of these species show some degree of fragmentation (subdivision) of the dorsal scales of the head. The new species, bridgesi, septemlineata and orcesi essentially replace one another geographically as one moves from the wet lowlands of western Colombia to the dry valley of the Rio Jubones in southwestern Ecuador. The decreasing moisture gradient from north to south is paralleled by decreases in both the number of dorsal scales (as counted from occiput to rump or around midbody) and degree of fragmentation of the dorsal head scales. The adaptive significance of scale size is discussed.

Fawcett, James D. (University of Nebraska at Omaha). Effects of Simultaneous and Sequential Treatments With Estradiol and Progesterone on the Oviduct in Ovariectomized Anolis carolinensis).

Two weeks after ovariectomy adult lizards were injected daily with either saline, 10 ug estradiol-17B (E), 50 ug progesterone (P), or 10 ug + 50 ug P for 14 days. Two groups of lizards received either 10 ug E + (days 1 - 14) + 50 ug P (days 8 - 14) or 10 ug E (days 1 - 7) + 50 ug P (days 8 - 14). The lizards

were maintained on a 16:8D photoperiod at 31° C. In addition seven untreated ovariectomized lizards were used as initial controls. Results indicated that (1) all hormone treatments caused significant increases in oviduct-somatic indices (OSI), size of the uterine glands and width of the lamina propria, (2) increase in OSI's and uterine glands in those lizards treated with E + P was similar but significantly different from the E- or P-treated lizards, (3) maximal increase in height of the uterine epithelium was induced by the E + P treatment for 14 days, (4) administration of E alone induced maximal increase in width of the lamina propria. The E + P treatments induced histological changes which were comparable to the condition of the preovulatory uterus. These results suggest that estradiol may interact with progesterone in the control of oviductal maturation in the lizard.

Feaver, Paul E. (University of Michigan) A Population Study of the Northern Watersnake, Natrix sipedon, in Southeastern Michigan.

A population of the northern watersnake, Natrix sipedon, was studied from 1973 to 1976 at the E.S. George Reserve, Livingston Co., Michigan. Three hundred fifty individuals were marked and recaptured for a total of 1050 captures. Young are born in late August or early September. Females have one litter per season. Average clutch size is about 12 young per female and is positively correlated with female size. Both sexes mature at the age of 24 months and at this age males range in size from 370mm to 450mm svl (snout-vent length) and female range from 475 to 630 mm svl. Survivorship varies greatly from year to year in all age classes of both sexes. Life tables were constructed from the fecundity and survivorship data.

Fisk, Robert M. (University of Chicago). The Role of the Trunk in the Locomotion of Some Scincid Lizards.

Motion picture films were made of locomotion in a morphological series of skinks, ranging from fully-limbed forms (Leiolopisma reevesii), to those with highly reduced limbs (Chalcides chalcides). Preliminary analysis of these films suggests that: 1) Species with highly developed limbs (L. reevesii) hold their trunk off of the substrate and produce little axial curvature during gaits faster than a walk. Thus, the limb musculature produces most of the locomotor thrust. 2) Forms with moderately developed limbs (Chalcides ocellatus) apply the trunk to the substrate and develop large curvatures uniformly down the trunk during locomotion. The limbs are rotated posteriorly by this axial bending, producing forward thrust. Some locomotor force is also derived from limb retraction. 3) Skinks with the most reduced limbs (C. chalcides) exhibit a lateral undulatory locomotion typical of other limbless reptiles. 4) Some skinks in which the limbs are reduced, but with the hind limbs larged than the fore limbs (Chalcides mionecton and Chalcides sphenopsiformis), produce large axial curvatures

of greater amplitude posteriorly. This causes posterior rotation of the hind limbs with little aid from the hind limb musculature. The above are general patterns which may be affected by the speed at which a skink is moving and the substrate upon which it travels.

Forester, Don C. (Towson State University). Homing to the Nest by Female Desmognathus oschrophaeus, With Comments On the Sensory Modalities Essential in Clutch Recognition.

During the Summers of 1972 and 1973, Desmognathus ochrophaeus females were moved two meters from their nests in an attempt to simulate natural displacement. Seventy-eight of 107 females (73%) successfully relocated their nest within 24 hours. Behavioral studies conducted in the field and the laboratory confirm the ability of females to locate their eggs in the presence of other unattended clutches. Females occassionally select and brood the eggs of a conspecific in preference to their own. When this occurred, the preferred egg mass was always more advanced developmentally. Behavioral experiments point to olfaction as the sensory modality most essential to clutch recognition and discrimination. The effectiveness of olfactory cues apparently increases as a clutch develops. The adaptive significance of this phenomenon will be discussed.

Fouquette, M. J., Jr. and A. J. Delahoussaye (Arizona State University). Sperm Morphology in the Hyla rubra Group, and its Bearing on Generic Status.

Spermatozoa in the Hyla rubra group (sensu lato) differ from those of all other species currently placed in the genus Hyla by presence of two tail filaments rather than one. Three distinct sperm-head shapes occur in the group; a few species fail to fit precisely these categories. Comparison of sperm structure in Leptodactyloids prompts speculation of possible separate origins of certain Hyloid groups from Leptodactyloid stocks. Anuran sperm structure seems conservative, and differences parallel those used as criteria in current classifications; thus, sperm morphology is deemed a valid and useful tool for anuran taxonomy. Based on the diagnostic sperm-tail difference, plus prior definition of the Hyla rubra group, elevation of the group to generic status is judged valid and is advocated. Five species-groups within the genus are tentatively identified, based primarily on sperm-head shape. It is suggested that the two-filament anuran sperm-tail is primitive to the single one.

Franz, Richard. (University of Florida). Feeding Behavior in the snakes, Regina alleni and Regina rigida.

The snakes Regina alleni and Regina rigida feed on hard-shelled crayfish, particularly those in the genus Procambarus. Both snake species capture crayfish in "ratsnake" fashion, i.e. by

immobilizing with their body coils. Ingestion is abdomen first thus taking advantage of the natural folding of the crustacean's appendages. Similar feeding methodologies suggest a close phylogenetic relationship between Regina alleni and Regina rigida. Analysis of gut parasites also supports this arrangement.

Fritts, Thomas H. (San Diego Natural History Museum) Evolutionary Considerations of Sizes and Shapes in Giant Tortoises of the Genus Geochelone in the Galapagos Islands.

The individual populations of giant tortoises commonly grouped as Geochelone elephantopus exhibit considerable divergence within the Galapagos Archipeligo. Study of 26 morphometric characteristics of the carapace and plastron allow delineation of three major morphological trends. The relative position of individual populations on one of these trends is reflective of basic size and shape differences. Bivariate and multivariate statistics are useful in defining these differences. the principal morphological trends appear to correlate with altitudinal distributions of the taxa. Large tortoises are found on islands or volanic peaks of high elevations. Smaller tortoises tend to occur on islands of low relief. Some evidence exists linking size and body form to climate and plant communities at different elevations.

Garber, Steven (Cornell University). Biogeography and Distribution of Iguana and Cyclura in the Greater Anteilles.

The ecologically similar lizard genera Iguana and Cyclura are allopatric. Cyclura is declining throughout much of its range in the Greater Antilles; Iguana has become established in the eastern Greater Antilles. Reasons for both phenomena will be discussed.

Garcia-Lozano, L. Carlos, and J. Steve Godley. (University of South Florida). A Computer Approach to the Biogeography of the Herpetofauna of the Pacific Lowlands of Mexico.

The Pacific lowlands of Mexico form a transition between the Nearctic and Neotropical Regions. In the same way that vegetational formations correlate with climatic patterns we hypothesize that clusters of herpetofaunal species correspond with plant biomes. The testing of this hypothesis is accomplished by devising a data matrix with 105 species as individuals and their abundances as attributes in each of 28 (15 minute-wide) latitudinal belts. Three qualitative and 10 quantitative similarity indices are used to generate similarity matrices, ordination plots and dendrograms. These analyses are performed on each of 18 taxonomic and/or ecologic groupings including: Amphibia, Sauria, Serpentes, Reptilia (including Testudinata and Crocodilia), total herpetofauna (hf), terrestrial hf, arboreal/epiphyllous hf, fossorial hf, tropical-arboreal hf, southern affinity-arboreal hf, and northern affinity-terrestrial hf.

Gartside, Donald F. and Herbert C. Dessauer. (Louisiana State University Medical Center). Protein Evidence For a Narrow Zone of Hybridization Between the Chorus Frogs Pseudacris triseriata and P. nigrita.

Proteins representing 25 presumed loci were surveyed by electrophoresis in tissue samples of Pseudacris triseriata feriarum and P. nigrita nigrita from Louisiana and Mississippi. Different phenotypes of malate dehydrogenase and isocitrate dehydrogenase characterized allopatric populations of the two species, but where their ranges meet along the Pearl River intermediate (presumed heterozygous) phenotypes occurred. Complete transition from enzyme phenotypes characteristic of one species, to phenotypes characteristic of the other, occurred within 20 km and the transition area may be as narrow as 10 km. Different combinations of phenotypes of the two diagnostic enzymes were consistent with some individuals being F_1 hybrids, and others, later generation hybrids. Two other enzymes, phenylalanyl•proline peptidase and heart type lactate dehydrogenase, show large changes in presumed allelic frequencies across the hybrid zone, but presumed alleles are shared between the two species. Supported by N.S.F. grant BMS 73-01252.

Gillingham, James C. (University of Oklahoma). Reproductive Behavior of the Rat Snakes of Eastern North America, Genus Elaphe.

The courtship and mating behavior of the eastern North American rat snakes Elaphe obsoleta, E. guttata and E. vulpina were studied in captivity over a three year period. Thirteen motor patterns were defined and used in the construction of sequence chains with subsequent analysis. Tongue-flicks, caudo-cephalic waves, forwarded-jerking movements and other parameters were measured and compared at the specific level. Significant species differences were noted with respect to motor patterns and receptivity. The basic colubrid pattern was divided into the following three phases: tactile-chase, tactile-alignment, and intromission and coitus.

Godley, J. Steve (University of South Florida). Ontogenetic Shifts in Food Habits of a Crayfish Eating Specialist: Regina alleni (Serpentes: Colubridae).

The feeding ecology of Regina alleni was studied for 20 months in a south Florida water hyacinth community. Feeding and reproduction occur throughout the year with juveniles (200 mm TL) being present year-round. Libellulid odonate naiads account for over 96% of the prey items identified in juvenile R. alleni digestive tracts. Adult prey items identified in juvenile R. alleni feed primarily on hardshelled procambarid crayfish. Juveniles consume 6 times as many food items as adult, but adults eat proportionately larger prey. Prey orientation in R. alleni is species specific and dependent on prey morphology with crustaceans being injested caudally and odonate naiads head first. Laboratory observations indicate that juvenile R. alleni are

active, diurnal, visual predators and immobilize larger prey by weak constriction. It is suggested that these ontogenetic shifts in food habits are correlated with differential: (1) prey availability, (2) pursuit and capture success, and (3) potential caloric content of prey species, and that they represent the optimal foraging strategy for R. alleni.

Gong, Juliann D.-U., Elizabeth S.-F. Chao and James D. Fawcett. (University of Nebraska and University of Nebraska Medical Center) Histological Changes in the Thyroid of Ovariectomized Anolis carolinensis Following Estradiol and Testosterone Treatments.

In this study the effects of estradiol-17B (1 ug/day) and testosterone (5 ug/day or 50 ug/day alone, or in combination on the thyroid of ovariectomized adult lizards were examined. The lizards were maintained on a 16L:8D photoperiod at the preferred body temperature of 31° C. Preliminary results indicate that all hormone treatments induced increases in follicular epithelial cell height; however, these differences were not significantly different from those lizards treated with saline. Maximal increase in size of the follicular epithelium and ratio of epithelial height to follicular diameter was induced by the 1 ug estradiol plus 5 ug testosterone treatment. The mean diameter of the large colloid containing follicles of lizards receiving 1 ug estradiol plus 50 ug testosterone was less than that of all the other groups, but this difference was significant ($P < .05$) only when compared to lizards receiving saline. While these observations are open to several interpretations, it is suggested that they indicate that increased levels of steroid hormones may be responsible for changes in the thyroid of breeding lizards.

Greene, Harry W. (University of Tennessee). Coral Snake Mimicry: Does It Occur?

Indirect evidence supports the hypothesis that certain Neotropical colubrid snakes are Batesian mimics of venomous coral snakes. (i) From northern Mexico to Panama the presence, arrangement, and relative widths of red, yellow, and black rings in Pliocercus change concordantly with the color patterns of different sympatric Micrurus. The correlation extends to three unusual localized variants of the presumptive models and mimics. (ii) The defensive behavior of Leimadophis epinephalus consists of anterior body flattening; this exposes an interscalar pattern of red and black bands that resembles a sympatric Micrurus. The color pattern is thus not cryptic becuase it appears only during the defensive display and makes the immobile snake more easily seen. Leimadophis epinephalus apparently does not bite, so the color pattern and behavior probably do not serve as a true aposematic display.

Haas, James D. (Tufts University). Individual Differences in the Vocalizations of the Bullfrog, Rana catesbeiana.

Individual differences in the mating calls of male Bullfrogs, Rana catesbeiana, were studied during the 1974-1975 breeding seasons at Pickman Pond, Bedford, MA. Fifty calls from each of 20 individually marked males were analyzed in terms of temporal and frequency parameters. The pulse rate (pulses/sec), the percent croak time ((sum of the total duration of each croak/total duration of the call) X 100, the utilization of the harmonically related frequency bands within each croak, and the frequency modulation patterns of these bands were characteristic of an individual. The variance among individuals was 2-3 times the variance within individuals (analysis of variance; $p < 0.05$ in all cases). The behavior of individual Males in response to a call depended upon the individual calling. Established neighbors evoked more calling and mild aggression (only an approach). Strangers (individuals from a distant shore or never previously observed in the area) evoked chasing and bouts of wrestling. Preliminary playback experiments, using calls recorded from a known neighbor and distant individuals (the same pond and a pond 25 miles away) yielded similar results. The call individuality and the behavioral data are discussed in terms of individual recognition and the social system of the Bullfrog.

Hall, Stephen P. (University of North Carolina, Chapel Hill). Path Characteristics in a Population of Eastern Box Turtles.

Box turtle movements are non-random in at least two respects: (1) there is a long-term tendency for turtles to remain within a relatively circumscribed area; (2) there is an orderly pattern in short-term changes in the direction of travel within day-ranges. I used the Breder-Stickel method to trail turtles and have examined the distributions of angles turned between successive trail segments through a Markov-chain analysis. The results are related to various environmental parameters - weather, vegetation, and topography - and to location on the home range.

Hendricks, Fred S. (Texas A&M University). Systematics and Evolution of Cnemidophorus tigris east of the Continental Divide.

Geographic variation in scalation and patterns of Cnemidophorus tigris east of the Continental Divide is presented. The population of C. tigris examined segregate into five recognizable units representing three chronologically disparate levels of divergence coinciding with the expansions and contractions of the Chihuahuan Desert. The marmoratus subspecies cluster and variolosus cluster represent the earliest divergence; pulcher represents an isolated and stabilized intergrade population formed from marmoratus and variolosus. The most recent divergence has occurred within the marmoratus and the variolosus clusters.

Heyer, W. Ronald (Smithsonian Institution). Studies in Larval Amphibian Habitat Partitioning.

The author is required to have an abstract so that he may orally present the paper rather than have it a title only paper. The author will doubtless talk on the titled subject. He is likely to present some data and get carried away in its interpretation.

Howard, Richard D. (University of Michigan). Mating strategies in Rana catesbeiana.

Mating behavior of bullfrogs, Rana catesbeiana, was observed during the summers of 1974-1976 at the E. S. George Reserve in Livingston Co. in SE Michigan. Mating success of males was determined by following marked individuals. Data on factors influencing mate selection by females and subsequent variation in male mating success were also obtained. The population has been toe-clipped for the past 6 years, providing valuable information on the influence of age on mating strategies.

Jayne, Bruce C. and Harold K. Voris. (Field Museum, Chicago). A Preliminary Look at the Evolution of Form and Function in the Costocutaneous Muscle System in Marine Snakes.

Data on the size, origin and insertion of the superior and inferior costocutaneous (CC) muscles are presented for 11 terrestrial, 2 amphibious and 11 completely aquatic species of snakes. The aquatic species exhibited more dorsal insertions than did the terrestrial species, for either or both the superior and inferior CC muscles. Most of the more dorsally inserted inferior CC muscles had origins proximal to the cartilaginous tip of the rib. Some of the fully aquatic forms also showed a reduction in the size of the inferior CC muscles. This variation in the CC musculature was accompanied by an increase in the number of ventral scutes in fully aquatic species and a consequent departure from hte 1:1:1:1 ratio of vertebrae, ribs, CC muscles and ventral scutes exhibited by terrestrial snakes. Although there are differences in degree and detail, all forms of terrestrial snake locomotion involve the vertebrae, ribs, CC muscles and ventral scutes. Observations indicate that the CC muscles function in the lateral undulation of marine snakes by maintaining an oval body form.

Jeffries, William B. and Harold K. Voris. (Dickinson College and Field Museum). The Identification of Pedunculate Barnalces Found on Malaysian Sea Snakes with Notes on Their Mode and Site of Attachment.

More than 1000 marine snakes from the Straits of Malacca (Malaysia) representing 13 species and 7 genera were surveyed for epifaunal organisms. The "goose barnacle", Dichelaspis

pellucida Darwin (Cirripedia) was found on 9 species of snakes, representing 5 genera. Three of the snake species examined were represented by relatively large samples. Twenty-five percent of 345 Lapemis hardwickii examined were infested, 13% of 326 Enhydrina schistosa, and 27% of 128 Hydrophis fasciatus. Some goose barnacles were found attached to every region of the external surface of the snakes although they appeared in greatest abundance on the posterior half of the body. The mode of attachment of these barnacles to the surface of the snake skin has been examined using scanning electron microscopy. These studies plus field observations on the fate of the barnacles during the snakes' shedding, allow us to begin to understand the dynamic nature of this symbiotic relationship.

Juterbock, J. Eric (Ohio State University). Significance of Morphological Variation in Three Species of Desmognathus (Caudata: Plethodontidae).

Information concerning inter- and intraspecific relationships of selected characteristics to size was obtained during a study of the taxonomic status of Desmognathus welteri and a comparison with D. fuscus and D. monticola. Many of these relationships have not been previously studied, while studies of others have yielded confusing or conflicting results. The number of costal folds between adpressed limbs is similar in recently transformed individuals of both sexes and becomes greater for females at increasing sizes (SVL) in D. fuscus and D. welteri; no significant difference exists for D. monticola. The number of costal folds between adpressed limbs increases in the sequence monticola - welteri - fuscus at almost any body size. The numbers of upper jaw teeth increase with size in both sexes and adult females have more of these teeth than adult males in all three species. The numbers of vomerine teeth remain essentially the same in females and decrease in males with increasing size. Males lose a few dentary teeth with increasing size, females gain these teeth with increasing size. For all three types of teeth, numbers of teeth tend to increase in the sequence fuscus - welteri - monticola for any given size or sex. Some possible explanations of, or mechanisms for, these differences are discussed.

Karlin, Alvin A., Sheldon I. Guttman, David M. Dennis, and George M. Labanick. (Miami University). A Biochemical and Morphological Analysis of the Relationship of Plethodon longicrus and P. yonahlossee.

Plethodon yonahlossee Dunn, 1920 and Plethodon longicrus Adler and Dennis, 1962 were collected from their type localities and three intermediate localities during the spring and summer of 1975. The taxonomic status of Plethodon longicrus was re-evaluated based on morphological analysis of color pattern and costal folds, and electrophoretic analsyis of 21 enzymatic and non-enzymatic loci.

Keen, W. Hubert. (Kent State University). Effects of Temperature and Moisture on the Foraging of Desmognathus ochrophaeus.

The effects of temperature and moisture on the foraging success of Desmognathus ochrophaeus were studied during one annual cycle of the surface activity in northeastern Ohio. Foraging success was independent of temperature above a certain minimum level, and thus during most of the annual activity period. Length of the seasonal activity period was defined by minimum temperature, with activity diminishing and ceasing when temperatures were in or below the 0°-5°C range. Foraging success was directly correlated with habitat moisture over a wide range of moisture levels, resulting in poor feeding success for salamanders in habitats of marginal quality. Other studies suggest that absolute abundance of prey and interspecific interactions are not critical factors determining predation success of D. ochrophaeus at the study site. The suitability of habitat with respect to moisture, and length of the seasonal period when temperatures exceed some minimum level, thus appear to determine the overall foraging success.

Krouse, John R., Frank J. Evans and James D. Fawcett. (University of Nebraska at Omaha). Testicular Responses to Different Doses of Melatonin in the Lizard Anolis carolinensis.

During the second week of December, 32 large (mean body weight, 5.67 g) Anolis carolinensis were randomly separated into four treatment groups: saline control, 2 µg melatonin (M), 10 µg M or 50 ug M. In addition six lizards were killed as initial controls. Injections of 0.05 ml were given subcutaneously in the neck region for 14 days. The lizards were kept on a 16L:8D photoperiod at 31° C. The mean gonadosomatic indices (GSI) of the treated lizards were not significantly different from each other, and all had larger GSI's than did the initial controls. However, the GSI of lizards receiving 2 µg M was not significantly different from the initial controls. Histological analysis showed that the 10 µg M and 50 µg M treatments caused a significant increase in diameter of the seminiferous tubules. The 50 µg M treatment produced maximal growth of the seminiferous tubule epithelium and all stages of spermatogenesis. Conversely, growth of the seminiferous epithelium in the 2 µg M-treated lizards was significantly inhibited, the lumina of the tubules were filled with debris and spermatozoa were sparse. These results suggest that dosage determines whether melatonin will stimulate or inhibit testis maturation in A. carolinensis.

Krzysik, Anthony J. (University of Pittsburgh). Comparative Demographic Ecology of Desmognathus in Western Pennsylvania.

No Abstract Received.

Lotter, Fred and Norman J. Scott, Jr. (University of New Mexico). Studies on the Polymorphic Salamander Plethodon cinereus in New England: Ecological Differentiation of the Morphs and Reproductive Ecology. *PAPER WITHDRAWN.

Studies of geographic and temporal variation in morph frequencies in New England (exclusive of Maine) show that the black morph is less adapted to cold climates than the red or striped morphs. In a dimorphic population of 30% black and 70% striped individuals the black frequency was significantly higher among juveniles than adults, indicating actual differential mortality. Young adult females apparently deposit eggs every other year, while older ones lay every year. There is a positive correlation between female size and the number of mature ovarian eggs possessed. Female blacks reach reproductive maturity at a larger size than striped females.

Lynch, John D. (University of Nebraska-Lincoln). The Systematic Significance of Variation of the Coccyx in Some South American Leptodactylid Frogs

The anterior end of the coccyx in Batrachophrynus brachydactylus, B. macrostomus, and Telmatobufo venustus exhibits vertebral form. The sacrococcygeal articulation is bicondylar in all three species and none has prezygapophyses on the coccyx; all three species have transverse processes and large spinal nerve foramina on the coccyx. These features are consistent with the idea that deletion of a vertebra through the sacrum has occurred. If that is so, the ancestors of Batrachophrynus and Telmatobufo should exhibit nine presacral vertebrae, a character-state heretofore associated only with the archaic frog family Leiopelmatidae.

Malaret, Luis. (University of Kansas). A Field Study of the Northern Prairie Lizard, Sceloporus undulatus garmani.

During the summer of 1974 northern prairie lizard, Sceloporus undulatus garmani, were studied in the northern edge of the sandhills in Bennett Co., South Dakota. The lizards were closely associated with the yucca plant (Yucca glauca) which was used as basking sites, protective and nocturnal retreats. A bimodal pattern of activity was apparent; the lizards were most active between 0900 and 1200 and then activity decreased, increasing at 1700. The density was 4.2 individuals per hectare. This species was the most commonly observed reptile in the study area. Hatchlings were first observed on July 22. The ecological significance of these data will be discussed.

Maple, William T. (Bard College, Annandale-on-Hudson, NY). Competition Avoidance Mechanisms in Three Species of Desmognathus.

Population structure, life history parameters, and larvae were studied in five populations of D. quadramaculatus, D. fuscus, and D. monticola in Ohio, West Virginia and North Carolina in

an attempt to determine the strategies which promote coexistence between ostensibly competing congeners. Where fuscus is sympatric with monticola in W. Virginia it has a lower reproductive effort than the allopatric Ohio population, suggesting a more K-selected strategy where congerers interact. These sympatric fuscus also have longer larval periods than allopatric Ohio fuscus (24 mo vs 11 mo). In N. Carolina, the larval period of monticola is the same as in W. Virginia (13 mo), however sympatric quadramaculatus, has a 24 mo larval period. In addition, the larvae of the larger of two sympatric congeners (W. Virginia fuscus and N. Carolina quadramaculatus) tend to grow and absorb their yolk faster, and have a greater allometric head growth than the smaller monticola. These differences between larvae could act to reduce competition by promoting habitat separation and by exaggerating size differences permitting the young to exploit different-sized prey.

Marangio, Michael S. (Louisiana State University, Baton Rouge). The occurrence of neotenic rough-skinned newts (Taricha granulosa) in montane lakes of southern Oregon.

Populations of neotenic rough-skinned newts were found in 7 lakes and ponds at elevations from 5720-6060 feet above sea level in the southern Cascade Mountains of Oregon. In localities where large numbers were observed, the proportion of salamanders retaining gills or gill stubs ranged from approximately 85-100 percent. Terrestrial conditions in the study area are harsh, due to long, cold winters and dry summer seasons. By remaining in the more stable aquatic environment, salamanders can better survive the drastic climatic changes. Taricha granulosa in the study area are probably facultative in their ability to metamorphose, since they are found with varying gill lengths, and gills are resorbed in the laboratory with and without exposure to thyroxine.

Mautz, William J. (Cornell University). Resource Partitioning by Lizards in a Cave Habitat.

Lepidophyma flavimaculatum (Xantusiidae) and Phyllodactylus lanei (Gekkonidae) occupy a system of caves formed by piles of granitic boulders at Puerto Marquez, Guerrero, Mexico. Both species are found on rock walls and in recesses inside the caves by night and day. While P. lanei frequently emerge onto the surface at night, L. flavimaculatum do so very rarely. Individual L. flavimaculatum occupy specific perch sites within caves and forage inside both by night and day. P. lanei feed on small arthropods, while L. flavimaculatum feed almost exclusively on the fruit of fig trees (Ficus spp.) which falls among the boulders and becomes available to the lizards inside.

Maxson, Linda (University of Illinois, Urbana). Convergent Evolution in the Hylid Frog Anotheca.

Protein evolution is primarily a divergent process, proceeding independently of organismal or morphological evolution (Wilson et al., PNAS, vol. 71, 1974). This makes proteins ideal tools for detecting cases of convergent anatomical evolution. A probable instance of convergent evolution, involving the monotypic genus Anotheca, was detected by comparative studies of serum albumin. On the one hand, Anotheca albumin is shown to be as similar to the albumins of several North American Hyla as the albumins of the North American Hyla are to one another. On the other hand, Anotheca albumin is very different from the albumins of the marsupial tree frogs, as different as are those of Hyla. Phylogenetic analysis of the albumin data indicates that Anotheca is phyletically a member of the subfamily Hylinae. Thus, its placement in the Amphignathodontinae was due to convergent morphological evolution in Anotheca to resemble the other genera of marsupial tree frogs.

Mc Coid, Michael J. (San Diego Natural History Museum). Preliminary Remarks on Introduced Populations of Clawed Frogs (Xenopus laevis) in Southern California.

Aspects of the biology of selected populations of X. laevis have been studied in southern California since 1974. Population densities, growth rates, and reproduction are estimated for populations in San Diego and Riverside Counties. Analyses revealed different densities and differential growth rates between adjacent populations. Reproductive characteristics of these populations are described. Frogs were found to breed as early as November and as late as June.

McDiarmid, Roy W. (University of South Florida) and John W. Wright (Natural History Museum, L.A. Co.). Chromosomes and the Relationship of the Scincid Lizard Neoseps reynoldsi Stejneger.

The meager chromosomal data available for the scincid lizard are sufficient to indicate a high level of chromosomal conservatism in the family. Using this apparent conservatism as a basis for a phylogenetic hypothesis, we examined the karyotypes of Neoseps reynolsi and 19 species of Eumeces, the group from which N. reynoldsi is thought to have been derived. These 19 species are representative of 11 of the 15 species groups of Eumeces as proposed by Taylor. N. reynoldsi and all but one species of Eumeces share essentially the same karyotype: 2N = 26 with six pairs of biarmed macrochromosomes and seven pairs of uni- and biarmed microchromosomes. The unique karyotype is that of E. schniederi. This karyotype consists of 2N = 32 with no macro-micro dichotomy, and is apparently identical to the karyotype of Scincus officinalis, a representative of a group thought to be closely related to the relatively primitive E. schniederi. Evolutionary and zoogeographic implications of these findings are discussed.

Means, Bruce. (Tall Timbers Research Station). Geographic Body Size Variation, Life History, and Growth Among Populations of a Streamside Salamander (Desmognathus brimleyorum) on Adjacent Mountains.

No Abstract Received.

Miller, Paul.
A Demographic Study of the Chorus Frog, Pseudacris triseriata.

Chorus frogs, Pseudacris triseriata, were studied in a piedmont environment (elevation=1450 meters) near fort Collins, Colorado, in the summer of 1975. The population studied was found to differ from proximate montane (70 Km away, elevation=2900m) populations of chorus frogs in the following ways: piedmont adults disappeared after the breeding season, piedmont frogs reached sexual maturity in one summer and piedmont frogs were more nocturnal and crepuscular than the more diurnal montane frogs. Individual growth rates of piedmont juvenile frogs were similar to growth rates reported for montane juvenile frogs. These differences are reflection of the different demographic strategies of this species in two environmental situations.

Mitchell, Joseph C. and M. J. Fouquette, Jr. (Arizona State University). A Gynandromorphic Cnemidophorus inornatus (Sauria: Teidae).

A morphological and histological description of a gynandromorphic Whiptail lizard is presented. The specimen appears typical of Cnemidophorus inornatus arizonae and seems to be a functional male. There are paired hemipenes; there is a testis and male ducts on the left, but an ovary with yolked follicles on the right. The possibility is discussed that the individual resulted from hybridization of a male C. inornatus X female C. uniparens (a sympatric, thelytocous species).

Novotny, Elizabeth Sherman. (University of Vermont). Effects of Thermal and Water Stress on Heart Rate in Bufo americanus and Bufo marinus.

Heart rates were measured in Bufo americanus and B. marinus as the toads were heated from 10°C to 30°C under different humidity conditions. Toads heated in an environment in which much water is lost from the skin (low humidity) exhibit higher heart rates than toads heated in a situation in which less water is lost (high humidity or oil-coated skin). This is especially noticeable at higher body temperatures. These results suggest that the elevated heart rates in the low humidity (high water loss) environment facilitate the replacement of water in the skin by the more rapid circulation of the blood.

Nowak, Robert T. and Edmund D. Brodie, Jr. (Adelphi University). Rib Penetration as an Antipredator Mechanism in Pleurodeles waltl.

The skin of salamanders contains granular glands which, in some species, produce a secretion which repels predators. The ribs of Pleurodeles waltl (family Salamandridae) penetrate the epidermis of the lateral body wall in a localized aglandular region surrounded by granular glands. The ribs of P. waltl are longer than those of other salamandrids of similar size (Taricha granulosa, Paramesotriton hongkongensis, Salamandra salamandra). Each rib, distal to its myoseptum, is surrounded by a loose sheath of connective tissue. Costal musculature inserts onto the anterior surface of each rib proximal to the myoseptum and other muscle fibers insert onto the connective tissue sheath. The tip of the rib lies just beneath the inner surface of the skin and is drawn forward penetrating the skin when certain antipredator postures are assumed. The tip of the rib would presumably transmit the secretions from the skin of salamander to a would-be predator causing increased pain if the rib tip lacerates the predator.

Obert, Hans-Joachim (University of Bonn, Germany). Hormonal Influences on Calling and Reproductive Behavior in Anura.

In mid-European anura two distinct forms of reproductive and calling behavior are apparent. In the "linear type" only a single self contained calling and reproductive period occurs. The development of the endocrine organs during the reproductive period are of linear pattern. The interstitial tissue in the testes exhibits a gradual recession in the activity of the androgen-producing cells. Members of the Ranidae and Bufonidae families belong to this type. In the second, the "oscillatory type", several separate calling and reproductive periods occur. They are interrupted by pauses in which no mating calls and deposition of eggs can be observed. The members of the Discoglossidae family belong to this type. In these toads the development of the endocrine organs shows oscillatory decrease and increase. Within the calling periods the toads are highly stimulated via androgenic hormones. The 3B-steroiddehydrogenase is highly active in the interstitial tissue. Within the pauses however the interstitial cells are less active. The activity of the 3B-steroiddehydrogenase is low. One of the most important adrogenic hormones, controlling calling behavior, is the testosterol because it induces atypical mating calls. It is suggested that other androgenic hormones, together with testosterol, control calling and mating behavior in anura.

Packard, Mary J. and Gary C. Packard. (Colorado State University). The Influence of Melatonin on Reproductive State in Male Callisaurus Draconoides.

Male Callisaurus draconoides were injected with 5 µg melatonin per day for 20 days; and matched control animals were given daily injections of the saline vehicle. Testes subsequently were prepared for histologic examination, and were classified as being near peak activity or as being in a state of regression. Testes from animals injected with saline were at peak activity, whereas those from lizards receiving exogenous melatonin were undergoing regression. Thus, melatonin, the putative hormone of the pineal gland, has an antigonadal effect similar to that reported for other vertebrates.

Pefaur, Jaime E. (Nuseum of Natural History, The University of Kansas). Ecological Study of Tropidurus peruvianus in Southern Peru.

Tropidurus peruvianus is an inhabitant of areas characterized by xeric vegetation. In Arequipa, Peru, it is distributed from the coast to the tolar mesothermal belt at an elevation of 2800 m, but does not occur in the extensive sandy desert plateaus. A 12 month- study of a population in the "Lomas" formation of the southern Peruvian coast, showed that T. peruvianus inhabits only the temporarily short-grass lower belts. Occasionally it extends upward in narrow tongues of xeric vegetation to the top of the "Lomas" at 1000 m, avoiding the more densily vegetated ravines where wetter conditions prevail throughout the year. A higher proportion of individuals were caught during the dry season.

Perrill, Stephan A. (Butler University). Color Preference in Eumeces inexpectatus.

In a laboratory test, lizards were given the choices of red, blue and neutral. Juveniles and adults showed a convincing preference for red. The preference for red shown by adults possibly facilitates sexual identification during the mating season when the male's head is red-orange. The lack of response to blue may indicate an avoidance of blue. The avoidance could reinforce tail-wag, a submissive posture displayed predominantly by blue-tailed juveniles and hatchlings. Similarly the juvenile response may be an avoidance of blue facilitating dispersal, or a response established in early development but not functional until sexual maturity.

Phillips, John B. (Swarthmore College). Possible Use of Weak Magnetic Fields by Orienting Salamanders.

Twenty-nine Cave Salamanders (Eurycea lucifuga) were collected in Giles Co., Va. and Greenbrier Co., W. Va. in August 1975 and placed in one of two training situations in which their principle direction of movement is either parallel to the true N-S axis (of approximately the same magnitude and vertical component but shifted clockwise 90° in the horizontal plane). Both groups are housed in light-proof corridors which have compartments containing limestone at either end. Movement

through the corridors is encouraged by shifting a water supply from one end to the other at two day intervals. Both corridors are aligned along the true N-S axis, but one is contained in a coil which produced the altered field in which the N-S axis is perpendicular to the corridor. For testing all 29 animals are released in the center of a cross-shaped testing apparatus (a combination of the two training corridors) which is aligned to coincide with the cardinal compass directions. Tests are carried out in both the normal and altered fields in order to shift the magnetic expected directions relative to other possible cues. In a number of the tests, representing each control situation, the two groups segregated significantly ($P < .05$) along the axes corresponding to the trained directions relative to the magnetic field.

Phillips, William L. and Robert H. Mount.
Relationships Within the Genus Acris (Anura: Hylidae) in Alabama.

The relationships among Alabama populations of cricket frogs were studied from 1973-76. Characters separating Acris crepitans from Acris gryllus were established after examining individuals from allopatric populations and used to determine the nature of the apparent intermediacy in sympatric populations. Introgression is apparently occurring in the Fall Line Hills physiographic province. Examination of collections made from one sympatric population over a 29-year period indicate that characteristics usually associated with A. crepitans are apparently more adaptive in the area inhabited.

Plummer, Michael V. (Harding College). Reproduction and Growth in the Turtle, Trionxy muticus.

Male Trionxy muticus mature in their fourth year at a plastron length of 80 mm and females mature in their ninth year at 140 mm. Clutch size averaging about 11 eggs, and number of clutches, are related to body size. Hatchlings have a mean plastral length of 24.5 mm and double in length by the end of their first year. Young males grow about 2 mm per month; females grow 2-3 mm per month. Growth rate decreases with maturity. Growth is individually variable and changes seasonally and yearly.

Pough, F. Harvey, Gary Kwiecinski, and Willy Bemis. (Cornell University). Melanin Deposits Associated With the Venom Glands of Snakes.

Melanin in the skin and superficial muscle and connective tissue in the heads of crotaline snakes (more than 25 species in the genera Agkistrodon, Bothrops, Crotalus, Lachesis, Sistrurus, and Trimeresurus) is locatlized over the brain and venom glands. Melanin was found in 5 sites associated with the venom glands. There is some reciprocity in distribution of melanin between the sites, and two high altitude rattlesnakes had denser melanin deposits than the other species examined. Colubrid snakes have

no comparable melanin deposits except for two opisthoglyph genera, Leptophis and Oxybelis, which have dense melanin deposits covering the superior labial glands (Duvernoy's Glands). Melanin in all these snakes is found in dorsal and dorsalateral aspects where it would intercept solar radiation before it reached the venom gland. This shield of melanin may reduce photodetoxification of venom in the gland by ultraviolet and visible light.

Pough, F. Harvey, Margaret M. Stewart, and Richard G. Thomas (Cornell University, SUNY Albany, Cornell University). Physiological Basis of Habitat Partitioning in Jamaican Eleutherodactylus.

Physiological characteristics of 4 species of Eleutherodactylus from Jamaica correlated well with differences in microhabitat distribution. Eleutherodactylus cundalli and E. gossei are endemic to Jamaica while E. planirostris and E. johnstonei are introduced. The native species are more abundant in cool, moist microhabitats while the introduced species are more common in warmer, drier areas. Frogs were acclimated to 20°C and a 14:10 L:D photoperiod to test several physiological characteristics. The introduced species tolerate greater heat and dryness than the native species.

	Native Species	Introduced Species
$\bar{X}$ Selected Temp. (°C)	22.1 - 22.9	25.7 - 27.3
CTM (°C)	36.0 - 36.0	38.7 - 39.2
Crit. Water Loss (%)	23.9 - 26.8	34.9 - 41.3
Evap. Rate (mg/cm^2 hr)	24.7 - 29.6	24.7 - 27.6

These physiological diffferences provide a basis for observed differences in distribution and activity.

Ralin, Dennis B. (Kentucky State University, Frankfort). Behavioral and Genetic Differentiation in a Diploid-Tetraploid Cryptic Species Complex of Treefrogs.

Two mating call parameters and 2 protein loci in diploid (Hyla chrysoscelis) and tetraploid (H. versicolor) populations are analyzed in a transect from central Texas to the Atlantic Coast. Four groups of populations can be distinguished in the complex. Eastern diploid populations have fast pulse rates, long calls, are fixed for the Ldb-100 allele, and have high frequencies of the Mdhl-83 allele. Western diploid populations have very fast pulse rates, short calls, are fixed for the Ldb-13 allele and have lower frequencies of the Mdhl-83 allele. Southern tetraploid populations have slow pulse rates, intermediate length calls, approximately equal Ldb-100/Ldb-13 frequencies, and intermediate Mdhl-83 frequencies. Northern tetraploid populations have very slow pulse rates, intermediate length calls, very high Ldb-100 frequencies, and high frequencies of Mdhl-83. Initial mating call differentiation in H. chrysoscelis was probably slight prior to giving rise to the tetraploid in the southwestern part of the range. Differentiation of the Eastern and Western diploids probably came about as a result of character displacement between sympatric Western diploid and Southern tetraploid populations. Subsequent occupation of similar geographic areas

has resulted in parallel gene frequencies and mating calls in allopatric diploid and tetraploid populations.

Pregill, Gregory K. (University of Kansas). Morphology of the neck region in Coluber constrictor (Serpentes: Colubridae).

Dissection of the axial musculature of numerous individuals of the racer Coluber constrictor has demonstrated that cranial mobility is effected most by several muscles confined to the neck region. Otherwise, the skeletal and muscular composition of the neck region is nearly identical to that of the trunk. This neck-trunk uniformity is necessary to insure smooth, synchronous flexion during locomotion, but apparently the arrangement has obscured the history of the neck region in colubrine snakes. The cervical muscles probably have been retained from a lizard ancestry, but homologies are uncertain. Work is now in progress to trace the morphological history of the ophidian neck region. Hopefully the results will be useful in understanding the evolution and functional significance of cranial mobility in snakes and other limbless vertebrates.

Sever, David M. (Saint Mary's College). Identity of an Enigmatic Eurycea (Urodela: Plethodontidae) from the Great Smoky Mountains of Tennessee.

Willis King reported in 1939 the presence at altitudes below 933 m in the Great Smoky Mountains of Tennessee an enigmatic Eurycea distinct from sympatric E. bislineata but clearly showing affinities with that species. After recent discovery of King's specimens, they were compared to the type series of E. junaluska from Graham County, North Carolina, and no differences were found in seven morphological characters. King's specimens are thus referred to E. junaluska, extending the known range of this species northwestward into three more major drainages of the Tennessee River. When compared to three samples of Smoky E. bislineata, King's E. junaluska differed from all samples in pigmentation, mean number of prevomerine teeth, and mean tail percent of total length. There was considerable variation among the samples of E. bislineata in other characters, some of this variation perhaps relating to altitudinal differences among localities for the samples. Some preliminary data indicate that Smoky Mountain E. junaluska may have a different breeding season than sympatric E. bislineata.

Thornton, Okla W. and Robert A. Thomas (Texas A&M University). The Status of the Houston Toad, Bufo houstonensis.

The Houston Toad, Bufo houstonensis, is probably on the verge of extinction. A concerted effort in the spring of 1975 to locate and define extinct populations revealed only two existing

in Bastrop and Burleson Counties, Texas. The toad has not been observed at any of the other previously known localities since 1967. Endangered status is probably due to habitat manipulation and hybridization. During the spring, 1976, a study was conducted to correlate environmental parameters with the toad's breeding activity. Data reveal that a number of factors appear to be involved in stimulating activity.

Tomson, Libby H. (Mississippi State University). Sun-Compass Orientation in Four Species of Ambystoma.

No Abstract Received.

Trauth, Stanley E. (Auburn University). Seasonal Ovarian Histology of the Eastern Collared Lizard, Crotaphytus collaris collaris (Say), from Arkansas.

The paucity of literature pertaining to lizard ovarian morphology led to this study of the histology of ovarian structures. Lizards were collected during the activity seasons of 1971-1972. Degenerating corpora lutea remain in the ovary as corpora albicantia and persist throughout the life of the lizard. Two types of follicular atresia are found to exist; both types in the regressed condition macroscopically resemble corpora albicantis. This indicates that macroscopic counts of corpora albicantia to estimate reproductive potential should be rejected and microscopic analyzes be adopted.

Van Devender, Robert Wayne (University of Michigan). Comparative Demography of Basiliscus basiliscus.

Two local populations, 2.5 airline km apart, of Basiliscus basiliscus were studied between 1971 and 1975 to determine if demography varied microgeographically. Size and age at maturity (130-135 mm SVL and 16-20 months, respectively) were identical at both sites; but females at one site produced two extra clutches per year (7 vs. 5) despite similar reproductive seasons. Females at the former site also produced larger clutches at most sizes (egg no. = -18 + 0.177SVL vs. egg no. = -12.7 + 0.137SVL, respectively). Significant annual and site differences were also seen in juvenile female and egg survivorship, respectively. All results are consistant with the hypothesis that these lizards react to local differences in the predictability of egg mortality by altering energy expenditure for reproduction.

Veloso, Alberto and Patricia Iturra. (Universidad de Chile). Chromosome Evidence for Different Phyletic Lines in the Frog Genus Eupsophus (Amphibia: Leptodactylidae).

The species presently included in Eupsophus can be separated into two groups on the basis of morphology and karyology. E. roseus

(2n=30) and E. vertebralis (2n=28) are included in the roseus group and have high chromosome number and the presence of telocentric chromosomes. E. monticola (2n=26), E. nodosus (2n=22) and a new species E. tumultuosus (2n=26) comprise the nodosus group with only submetacentric and metacentric chromosomes. In the nodosus group an intercalary secondary constriction in chromosome and morphology, we consider the roseus and nodosus group to be generically distinct. The name Alsodes (Bell 1843) is available for the nodosus group.

Voris, Harold K. and Helen H. Voris. (Field Museum, Chicago). The Natural Food and Feeding Behavior of a Marine Snake, Enhydrina schistosa (Hydrophiidae).

The stomach contents of 364 adult and 516 juvenile Enhydrina schistosa collected from the Straits of Malacca over a 10 month period have been analyzed. The principal food of both adults and young are catfish of the family Tachysuridae. The diet of adults is slightly more generalized than that of the young. Twenty-five juvenile E. schistosa between the ages of one and six weeks were observed feeding a total of 42 times in the laboratory. Feeding behavior followed a constant pattern which included seven discernible components: Search, Recognition, Strike, Hold, Pre-ingestion positioning, Ingestion, and Post-ingestion. There is some evidence that several of these feeding stages include behaviors which are specializations to feeding on prey which have large, barbed, poisonous pectoral and dorsal spines, and to feeding in flowing water.

Wake, David B. and Ronald W. Marlow. (University of California). A New Species of Plethodontid Salamander From the California Desert.

An undescribed species of Batrachoseps has recently been discovered in the Inyo Mountains of California. This desert mountain system has previously been thought to provide inhospitable habitats for plethodontid salamanders. The new species, found in several canyons, is the most generalized member of the genus, and seems to represent a very early derivative of the Batrachoseps lineage. Relationships within Batrachoseps are discussed. In osteology the new species is closer to the postulated common ancestor of the tribe Bolitoglossini (including Batrachoseps, Hydromantes, and the neotropical genera) than is any other living species.

Wake, Marvalee H. and Susan M. Case. (University of California). The Immunological Comparisons of Caecilian Albumins.

Analysis of relationships of six genera of caecilians (Amphibia: Gymnophiona: Ichthyophis, Dermophis, Gymnopis, Caecilia, Geotrypetes, Boulengerula) by microcomplement fixation gave immunological distances of from 70 units to 210 units for Dermophis sera to sera of the other genera. Times of divergence indicated

for these genera are consistent with those postulated on zoogeographical grounds. Gymnopis and Dermophis appear to have diverged from each other in the Oligocene, Dermophis from the Caecilia stock in the early Eocene, adn the Dermophis stock from the African and the southewat Asian stocks in the early and mid-Cretaceous.

Wassersug, Richard J. and Stevan J. Arnold (University of Chicago). Differential Predation on Tadpoles, Metamorphosing Individuals and Frogs by Garter Snakes (genus Thamnophis).

Garter snakes are common predators on frogs and tadpoles. Stomach contents of wild-caught garter snakes, Thamnophis sirtalis and Thamnophis elegans, show a preponderance of anuran prey at the peak of metamorphic transformation. Laboratory experiments using Thamnophis sirtalis as a predator and the chorus frog Pseudacris triseriata as a prey show that T. sirtalis capture significantly more individuals in transformation than postmetamorphic frogs. On land, transforming individuals are less successful as escaping snakes than are juvenile frogs. The retention of the tail in transforming individuals appears to hinder saltatory locomotion. In water, transforming larvae appear to be hindered in their swimming by protruding forelimbs. By positioning themselves at the margins of ponds, snakes may increase their chances of encountering transforming anurans. By emerging at night, transforming anurans spend a disproportionately short time in metamorphic transformation. Snake predation and other hazards may have selected for the rapid metamorphosis of anurans.

Weatherby, Craig and Sheldon I. Guttman. (Auburn University and Miami University). Enzymatic Inheritance in the Queen Snake, Regina septemvittata.

A variety of enzymes and other proteins from various tissues of the progeny from 10 female Regina septemvittata were analyzed electrophoretically. The alleles of the polymorphic loci were inherited codominately in typical mendelian fashion.

Werner, J. Kirwin and Mark B. McCune. Amphibian Productivity in a Northern Michigan Pond .

Total amphibian productivity was estimated during the spring and summer of 1974 within an enclosed pond-marsh habitat in the Cyrus H. McCormick Experimental Forest, Baraga County, Michigan. Eight species were encountered within the study area, three of which, Notophthalmus viridescens, Rana catesbeiana, and R. pipiens were found only occasionally, did not appear to breed, and were not included in productivity estimates. Total productivity was estimated as 70 Kcal/m^2/yr. Individual figures were 27 Kcal/m^2/yr for Hyla crucifer, 14 Kcal/m^2/yr for Bufo americanus, 17 Cal/m^2/yr for R. clamitans, 6 Kcal/m^2/yr for R. septentrionalis, and 6 Kcal/m^2/yr for R. sylvatica. Approximately 95% of all productivity was involved in the growth and development of tadpoles.

Wills, Fred H. (Texas A&M University). Geographic Variation in Sceloporus parvus Smith.

The iguanid lizard Sceloporus parvus occurs in eastern Mexico along the Sierra Madre Oriental from northern Coahuila to Hidalgo. Two subspecies have been described to date. Examination of approximately 300 specimens revealed that intrapopulation variation of scalation is considerably greater than previously known. Data were analyzed using various univariate and multivariate methods. It was found that variation is essentially clinal from north to south within the species' distribution. A disjunct population in west-central Tamaulipas was found to be well-differentiated from other populations.

Wilson, A. C.[1], G. L. Bush[2], S. M. Case[3], J. L. Patton[3], and M.-C. King[4]. (1- University of California, Berkeley 2- University of Texas, Austin, 3- University of California, Berkeley, 4- University of California, San Francisco). An Analysis of Rates of Chromosome Evolution and Speciation in Vertebrates.

To test the hypothesis that organismal evolution is largely dependent on gene rearrangement, chromosomal diversity was examined in 225 genera of vertebrates also possessed a fossil record. Chromosomal evolution has been faster in mammals, which have also evolved rapidly anatomically, than in other vertebrates. Rates of protein evolution appear similar in all groups. Social structuring of mammalian populations may promote both rapid fixation of gene rearrangements and rapid speciation by effectively creating many small populations isolated from each other. Such small populations are not found in other vertebrates and consequently rates of chromosome evolution and speciation are much lower.

Wygoda, Mark L. (University of South Florida). Terrestrial Activity of Kinosternon baurii in a Seasonal Hardwood Swamp Forest.

A population of Kinosternon baurii was studied using the mark-recapture method from March, 1975 to April, 1976 in and around a temporary pond in Hillsborough County, Florida. Movements into and out of the pond were monitored by a drift fence and pitfall traps encircling the pond. Trailing devices were attached to the carapace of selected emigrants to determine direction and distance of terrestrial movement. A total of 157 captures was made on a marked population of 67 turtles. The sex ratio of 66 turtles was 1♂: 2.00♀. Terrestrial activity was positively correlated with incidence of rainfall 48 hours previous to capture. Turtle density in the pond was correlated with water level. Minimum densities occurred during lowest water levels when turtles were burrowed underground in the surrounding forest and during high water levels when turtles presumeably were foraging in nearby seasonal swamps.

Wortham, J. W. Edward, Jr. and Judith A. Murphy. (Old Dominion University). Scanning Electron Microscopy of Some Salamander Spermatozoa.

No Abstract Received.

Zappalorti, Robert T. (Staten Island Zoo). The Ecology of the Bog Turtle, Clemmys muhlenbergi, in Western North Carolina.

An ecological study of the bog turtle was begun in southwestern North Carolina in the spring of 1975. Populations were located in sphagnum bogs and marshy meadows at seven localities, and 54 individuals were observed during April, May and June. The physical and vegetational characters of each habitat were analyzed. The turtles were measured, weighed, individually marked, and released at the point of capture. Continuation of the investigation in the spring and summer of 1976 has resulted in a high frequency of recaptures of marked turtles, and has provided information on population structure, breeding habits, growth, activity and movements. (Research support by the Highlands Biological Station, Highlands, N.C., the National Audubon Society and the Staten Island Zoological Society).

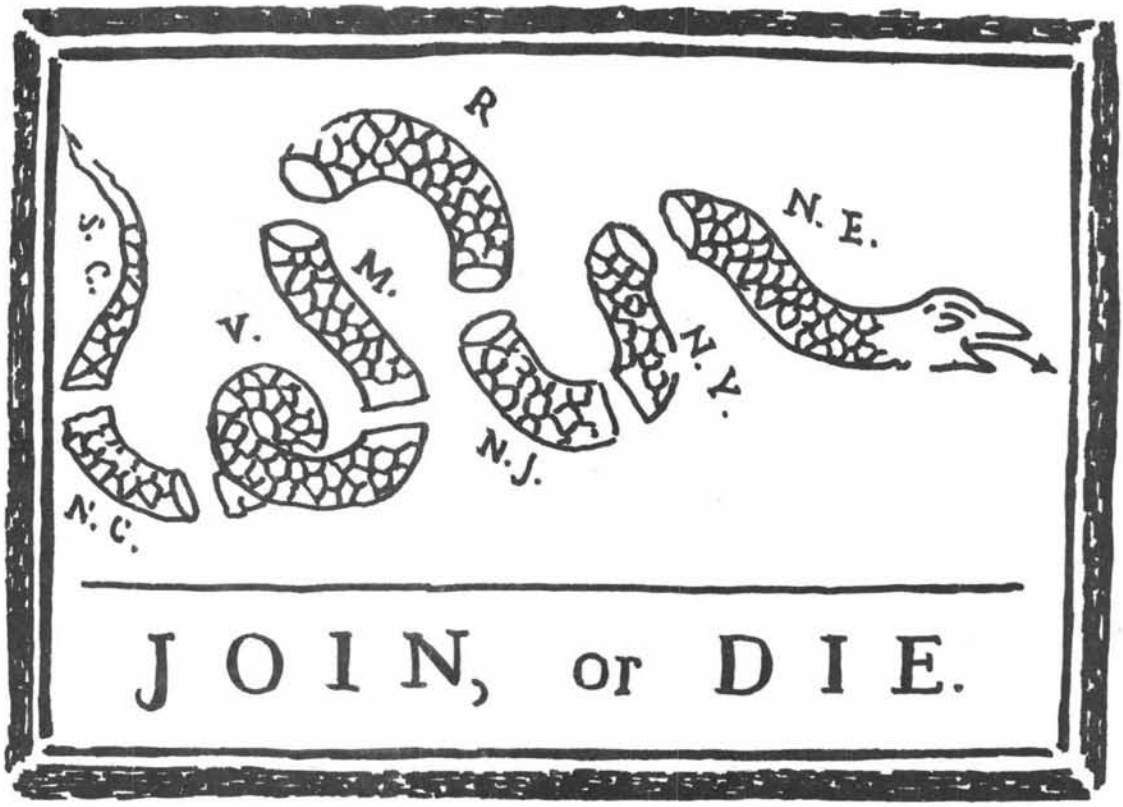

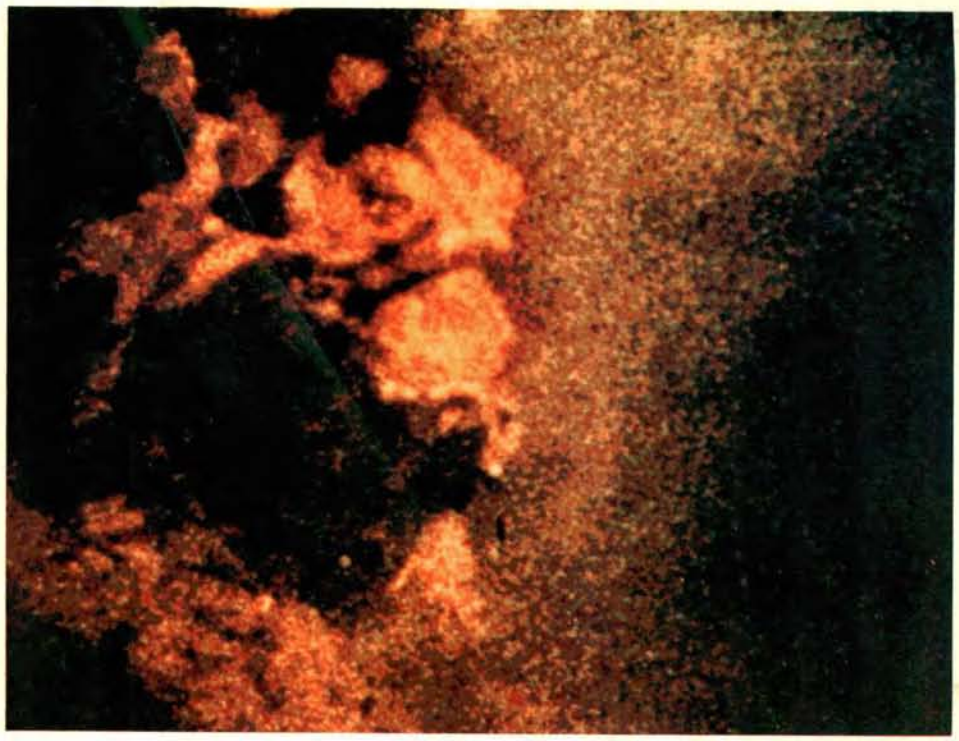

PLATE I (A) Photograph taken at 4:32 AM, 20 June 1975, purportedly of the upper body, neck and head; note absence from adjacent frames taken at 1.2 min intervals from center shot. Light cone and densitometric measurements indicate that "body" was at distance of 25 ft and "neck" was about 10 ft long.

(B) Photograph taken at 11:45 AM, 20 June 1975, showing "head". This series of six frames (intervals, 1.2 min) records a period of major disturbance, with the camera swinging upward; note bottom of boat, length 20 ft. The center shot, enlarged at right, is interpreted by Wyckoff's group as the head, showing bilateral symmetry in half-profile; note the mouth and nostrils at right and the several horn-like protrusions. An interpretive drawing by Sir Peter Scott is shown at bottom. The "head" was about 5 ft from the camera and is estimated to be 2 ft long. Camera-strobe arrangement for all photos in plate I is shown in fig. 4. (All photographs copyright Academy of Applied Science)

Dr. D. Bourn, Oxford. "Population dynamics of the giant tortoise."

C. Sapsford, University of Natal. "Temperature regulation during diving in the freshwater turtle Pelomedusa subrufa."

J.C. Grieg, Grahamstown. "The distribution of non-marine tortoises and turtles (Testudinata) in South Africa."

Prof. Y.L. Werner, Hebrew University of Jerusalem. "Distribution and variation of African geckos in extreme southwestern Asia."

E. Franckenberg, Hebrew University of Jerusalem. "Activity pattern and vocalisation in African geckos in southwestern Asia."

W.C. Haacke, Tvl. Museum. "Reptiles of the arid parts of South Africa."

Dr. W.R. Branch, Atomic energy board. "Survey of hemipenal morphology of South African snakes."

A.J.L. Lambris, Salisbury. "Surgical treatment of necrotic panophthalmitis in snakes."

SECTION B: AMPHIBIA

Prof. W.W. Mayhew, University of Calif. Guest speaker.

A. Channing, Natal University. "Agressive behaviour in Phrynomerus annectens."

Dr. D.E. van Dyk, Natal University. "Habits and dispersal of South African Anura."

N.I. Passmore, University of Witwatersrand. "The mating calls and breeding biology of the genus Ptychadena in South Africa."

Prof. Lamotte, Paris. "A propos des Ptychadena (Ranidae) de l'Ouest Africain."

Dr. J.P. Loveridge, University of Rhodesia. "Strategies of water conservation in Anura."

Dr. J.C. Poynton, Natal University. "Notes on the biology of Breviceps."

Prof. R. Laurent, Argentina. Guest speaker. "On the Hyperolius viridiflavus superspecies in Central Africa."

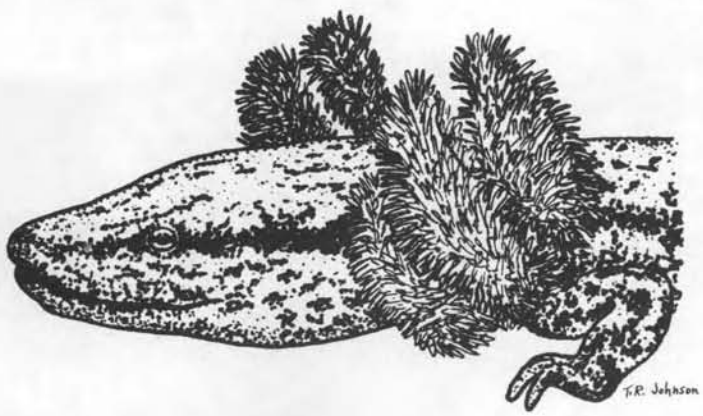
Dr. A. Schiotz, Denmark. "Ecological and zoogeographic patterns in the distribution of African treefrogs."

Dr. W.F. Blair, Texas. "Evidence for past interchange of anurans between Africa and other continents."

C.R. Parry, Queen Vistoria Museum. "Amphibian development in the larval stage."

Dr. J.M. Savage, University of Southern California. "Consumer organisation and interactions in two lowland tropical ecosystems: a comparison of herpetofauna and the leaf-litter community."

Dr. L.P. Knoepfeler, France. "Regime alimentair d'Aubria subsigillata au Gabon."



Fredric L. Frye, D.V.M., a specialist in the veterinary care of reptiles, will conduct an intensive three-day course, "Practical Husbandry, Medicine and Surgery of Captive Reptiles," on Friday, Saturday and Sunday, April 23, 24 and 25, 1976, at the Monteleone Hotel in New Orleans, La.

The course is intended for veterinarians, personnel in research and educational institutions, herpetologists, animal keepers and others concerned with the health care of reptiles.

Topics for slide-illustrated lectures and discussions will include: Husbandry, Medicine, Pathology, and Surgery.

The registration fee for the three-day course is $110. Advance enrollment is advised. A number of partial scholarships are available for full-time students; applications should be made to Dr. Nathan Cohen, University Extension. The California Academy of Veterinary Medicine will grant California veterinarians 15 credits toward membership; veterinarians in other states may request credit from their state associations.

For further details and hotel reservations, at reduced rates, write to Dr. Nathan Cohen, Continuing Education in Sciences and Mathematics, University of California Extension, Berkeley, CA 94720, or call (415) 642-1061.

N. C. STATE MUSEUM ANNOUNCES NEW JOURNAL

The North Carolina State Museum of Natural History announces a new journal, BRIMLEYANA, the Bulletin of the N.C. State Museum. Contents will emphasize the zoology and general ecology of the southeastern United States, especially North Carolina and adjacent areas. Consecutively numbered issued will appear at irregular intervals.

Information for potential contributors of BRIMLEYANA may be obtained from the Editor (Dr. John E. Cooper, Director of Research and Collections), and purchase and exchange information from the Managing Editor (Mrs. Sarah S. Robinson, Director of Publications) at: N. C. State Museum of Natural History, P. O. Box 27647, Raleigh, NC 27611. Dr. John B. Funderburg, Director of the Museum, is Editor-in-Chief.

Roberto Donoso-Barros
1922-1975

OBITUARY

Professor Arthur Hughes died suddenly from a heart attach on 13 Aug. 1975. He was a distinguished biologist, an exceptionally warm-hearted man and will be missed.

Arthur Hughes began working on neuro-embryological development as a student at Cambridge University in the early 1930's. Developmental biology, stimulated by the discoveries of Hans Spemenn, C.H. Waddington and others on induction mechanisms in embryos, was at a particularly exciting phase.

He worked at Cambridge until 1957 when he made the first of several visits to teach and research at the University of the West Indies in Jamaica. There he made the important discovery that one of the small Caribean frogs Eleutherodactylus martinicensis, an animal previously almost unknown to experimental embryologists, had remarkably few cells in its central nervous system and was therefore exceptionally valuable for studies on neuroembryology. After over thirty years of inspired and meticulous studies, he made fundamental discoveries on the relationships between cell numbers in the spinal cord and the onset of neuromuscular coordination and the development of behavior patterns in different species of animals.

It was typical of him to decide to emigrate to America in 1967 where in his late fifties continued to research actively as a Professor at the Developmental Biology Center at Case Western Reserve University, Cleveland. A good, kind man, with a wife, home and adopted country that he loved, his last years were perhaps some of his happiest. He deserved them.

EDITORS NOTE: The death of A. Hughes published in HR 6(4) referred to Arthur Hughes and not Andy Hughes. Andy Hughes informed us that he was alive and well at the University of Oklahoma.

I.C.Z.N. TO CONSIDER A PROPOSAL TO CONSERVE THE NAME RANA SPHENOCEPHALA COPE

In Aug. 1975 we submitted the manuscript "Request for the Conservation of Rana sphenocephala Cope, 1886, and the Suppression of Rana utricularius Harlan, 1826 and Rana virescens Cope, 1889 (Amphibia: Salientia)" for consideration by The International Commission on Zoological Nomenclature. On 11 Dec. 1975, R. V. Melville (Secretary, I.C.Z.N.) wrote us that the Commission has agreed to consider this proposal. An announcement that the proposal has been received will appear in the Bull. Zool. Nomencl., vol. 32, part 4 (probably in Jan. 1976) and the ms. will be published later in 1976. Mr. Melville has furthermore indicated that publication of the announcement automatically activates the revised Article 80 of the International Code of Zoological Nomenclature. That amendment specifies: "When a case is under consideration by the Commission, existing usage is to be maintained until the decision of the Commission is published." and "A case is deemed to be under consideration by the Commission from the date of publication in the Bulletin of Zoological Nomenclature of a notice of the reception of the application" and "the words 'existing usage' are to be taken to mean the most common usage." (Bull. Zool. Nomencl. 31 (2):89, 1974, and 32(2):65, 1975). The name R. sphenocephala has had far greater usage for the taxon under consideration than either of the names R. utricularius or R. virescens. Consequently, R. sphenocephala is the appropriate name until the Commission takes action.

Lauren E. Brown, Dept. of Biological Sciences, Illinois State University, Normal, Ill. 61761, Hobart M. Smith, Dept. of Environmental, Population and Organismic Biology, University of Colorado, Boulder, Colo. 80302, and Richard S. Funk, Dept. of Biological Sciences, Illinois State University, Normal, Ill. 61761.

MEETINGS

The 5th International Symposium on Animal, Plant and Microbial Toxins will be held in San Jose, Costa Rica on August 8-13, 1976 under the auspicies of the International Society on Toxinology and the University of Costa Rica.

Interested persons may write to:

Dr. Roger Bolaños
Instituto Clodomiro Picado
Universidad de Costa Rica
Ciudad Universitaria
San Jose, Costa Rica

SOCIETY OF SYSTEMATIC ZOOLOGY
May 30 to June 4

Higher Categories of Vertebrate Systematics:

This symposium, sponsored jointly by the Society of Systematic Zoology and the American Society of Zoologists is scheduled for June 3rd. The symposium will consider all groups of vertebrates within the framework of a cladistic reference system. Scheduled speakers are Gareth Nelson, Colin Patterson, Eugene Gaffney, Malcolm McKenna, Joel Cracraft, and Allan Brush.

MEETINGS

The Annual AIBS Meetings will be held 30 May-4 June at Tulane University, New Orleans, Louisiana. Within these meetings the American Society of Zoologists are preparing symposia including: 1) Communications and Display Behavior in Reptiles, 2) Higher Categories of Vertebrate Systematics, and 3) Endangered Wildlife (cosponsored with the Ecological Society of America). Contact: Dr. Eugene Gaffney, American Museum of Natural History.

HERPETOLOGIST

We anticipate an opening at the Assistant Professor level with appointment effective 1 September 1976. Duties are to include 1) development of a productive research program in one or more of the following areas of herpetology: biogeography, population biology, systematics, comparative behavior, or paleontology; 2) teaching in introductory general biology or zoology; 3) development of a specialized course and graduate program in herpetology; 4) supervision of organization and maintenance of herpetological collections. Applicant should have a Ph.D. and a strong commitment to research and teaching.

Applicants should send full curriculum vitae and names and addresses of three referees to Dr. James A. Slater, Biological Sciences Group, University of Connecticut, Storrs, Conn. 06268. Telephone: (203) 486-4323. Deadline for receipt of applications is 1 April 1976. The University does not discriminate against any person on the basis of race, color, religion, national origin, sex, age, or physical disability.

A NEW SPANISH HERPETOLOGICAL SOCIETY

The Asociacion Iberica de Herpetologia was founded October, 1975. If interested contact Carlos Perez-Santos, c/o Asociacion Iberica de Herpetologia, Estudio y Defensa de Los Reptiles y Anfibios, Avenida de Logrono, 23, Madrid-22 (Espana).

Robert W. Henderson of the Milwaukee Public Museum, and Henry S. Fitch of the University of Kansas have received a grant from the Banco Central in Nicaragua to study the large edible iguanas (*Ctenosaura similis* and *Iguana iguana*). The Bank is concerned about the status of these lizards and wants to determine what conservation measures can be taken to prevent their local extermination.

RECENT DEATHS

Barry Rothman, former editor of the Bulletin of the Philadelphia Herpetological Society, died of a heart attack on 13 January 1976 at the age of 40. Together with his former wife Norma, they were the prime movers of PHS for about 10 years.

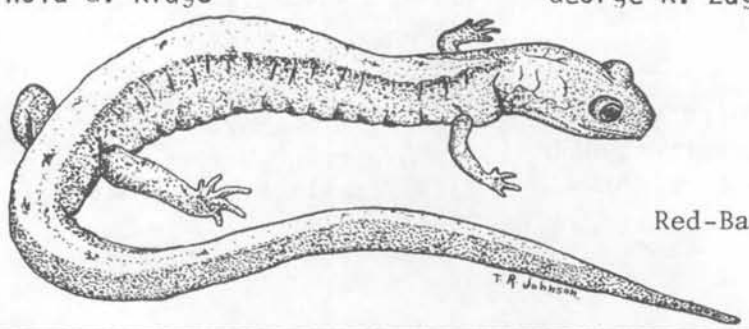
HERPETOLOGICAL SKELETONS,SKULLS & SKINS. Send for illustrated pricelist to HERP OSTEO-SPECIMENS, 11324 Ventura Blvd., No. Hollywood, CA 91604.

****

The State of Florida has recently passed regulations protecting its endangered and threatened herps. As of 1975, it is illegal to take or possess or sell or offer for sale any of the following species without a permit from the Game and Freshwater Fish Commission: Endangered: Pine Barrens tree frog, all sea turtles except Loggerhead, East Coast saltmarsh snake, Short-tailed snake, American crocodile. Threatened: Keys Mud turtle, Suwannee cooter, loggerhead sea turtle, gopher turtle, Keys Moleskink, Sand skink, Big Pine Key ringneck snake, rosy rat snake, Miami black-headed snake, Key's populations of Brown and Ribbon snakes, and American alligator.

Permits are required for threatened species only where they are not regulated elsewhere in the regulations. The Gopher Tortoise, for example, still has a bag limit of 10 for food or whatever, even though considered threatened!

Any species which is also on the Federal Endangered Species list will require a federal permit in addition. Application for a federal permit should show evidence that a state permit has been obtained.



****

"The Herpetofauna of the San Gabriel Mountains, Los Angeles County, California" by Allan A. Schoenherr will be published in early 1976 by the Southwestern Herpetologist's Society. Each of the 52 species accounts will include information on distribution, activity patterns, San Gabriel Mountain localities, and a range map. The book will be about 110 pp., illus. with 14 figs., 20 maps, 3 tables, and color cover. The book is available for $5.00 ($3.00 to Southwestern Herpetologist's Society members) from Linda Dandy, Southwestern Herpetologist's Society, 2344 Norwalk Ave., Los Angeles, Calif. 90041.

Need Reptile Identification Tags?

Kimball Systems has them!

Kimball Systems is THE source for reptile identification tags...and Kimball has more than 100 years of experience in making tags of every kind.

With Kimball, you can be certain that your tags will be made to precise specifications and rigid standards of quality. They can be printed on one or both sides, in non-soluble and waterproof inks... on a broad range of impervious and solvent-resistant stocks... and can also be consecutively numbered.

Kimball Systems Product Representatives are located coast-to-coast. They will be happy to discuss your tag requirements and offer practical suggestions. Just contact the address below.

ANNOUNCEMENT OF SSAR - HL MEETINGS MIAMI UNIVERSITY, OXFORD, OHIO
8 - 12 AUGUST 1976

In addition to the contributed paper sessions Miami University is sponsoring a symposium entitled "Reproductive Biology of Amphibians" organized by Drs. Taylor and Guttman, Miami University, and moderated by Dr. Thomas Uzzell, Philadelphia Academy of Natural Sciences. The following speakers have accepted an invitation to participate in this symposium:

Dr. Leszek Berger
Dept. Agrobiology
Institute of Ecology
Polish Academy of Sciences
Poland
Topic: Systematics and hybridization in the Rana esculenta complex

Dr. Hansjorg Blankenhorn
Zoologisches Institute des Universitat
Zurich, Switzerland
Topic: Reproductive behavior in European Ranids

Dr. Giorgio Mancino
Instituto di Zoologia dell 'Universita
Pisa, Italy
Topic: Karyology, Cytogenetics and species hybrids of European newts

Dr. Stephen G. Tilley
Dept. of Biological Sciences
Smith College
Northhampton, Massachusetts 01060
Topic: Reproductive Ecology of North American Plethodontids

Dr. Steven J. Arnold
Dept. Biology
University of Chicago
1103 E. 57th St.
Chicago, Illinois 60637
Topic: Courtship behavior in North American Plethodontids

Dr. Max A. Nickerson
Vertebrate Division
Milwaukee Public Museum
Milwaukee, Wisconsin 53233
Topic: Reproductive biology of Paedogenic Salamanders

Dr. Lynne Houck
Museum of Vertebrate Zoology
Dept. of Zoology
University of California
Berkeley, California
Topic: Reproductive biology of Neotropical Salamanders

Dr. Hans Schneider
Zoologisches Institut
Universitat Bonn
Germany
Topic: Acoustic behavior and reproduction in European anurans

Dr. Murray Littlejohn
Dept. Zoology
University of Melbourne
Australia
Topic: Reproductive behavior and Ecology of Australian anurans

Dr. Toshijiro Kawamura
Dept. Zoology
Director of the Laboratory for Amphibian Biology
Topic: Review of the research program at the Japanese Amphibian Research Facility

Dr. Marvalee H. Wake
Dept. Zoology
4079 Life Science Building
University of California
Berkeley, California 94720
Topic: Reproductive biology of Caecilians

Dr. Robert Capranica
Section of Neurobiology and Behavior
Cornell University
Ithaca, New York 14850
Topic: Auditory processing of Vocalizations in Amphibians

Dr. Timothy Halliday
Dept. of Zoology
Animal Behavior Research Group
South Parks Road
Oxford, England
Topic: The comparative reproductive ethology of European newts. An evolutionary prospective.

The titles given above represent only working titles at this time. The full agenda of the symposium will be published in the June issue of Herp. Rev. 7 (2).

Schedule of Events:

The Meeting and the Symposium will be held in the Miami University Student Center.

8 Aug., Sunday	- 1200-1730	- Registration, Lobby, Miami Univ. Student Center
	- 2130	- SSAR Board Meeting, Room 237
9 Aug., Monday	- 0800-1200	- Registration
	1300-1700	- Registration
	- 0900	- Symposium on Reproductive Biology of Amphibians begins. Opening remarks by Dr. Uzzell in Heritage Room.
	- 0915-1145	- Symposium
	- 1330-1715	- Symposium
	- 2000	- Social
10 Aug., Tuesday	- 0900-1145	- Symposium
	- 1300-1515	- Symposium
	- 1545-1700	- Contributed Papers
	- 1700	- SSAR Business Meeting (Heritage Room)
	- 2000	- Chicken Dinner
11 Aug., Wednesday	- 0900-1200	- Contributed Papers
	- 1330-1715	- Contributed Papers
12 Aug., Thursday	- 0900-1200	- Contributed Papers (The number of contributed papers received will determine whether or not this session will be needed.)

An optional field trip to S.E. Ohio is also planned for Thursday. If you wish to go on this field trip, please fill out the attached form on the pre-registration sheet.

Housing: An air-conditioned conference dormitory is located one block away from the University Center. In anticipation that most people will want to make use of this facility, we have reserved room for at least 300 persons. Conference dormitory rates are: $6.00 per day per person for a double room and $8.50 per day per person for a single room (towels and sheets provided).

Room fees should be paid upon check-in. In order to facilitate check-in at the Conference Center, we would appreciate your filling out the housing form attached to the pre-registration packet and returning it when you pre-register. These facilities are convenient and are run in a manner similar to that of a motel. A limited number of family suites are also available. If you prefer to stay in a motel the following moderately priced motels are within three miles of campus:

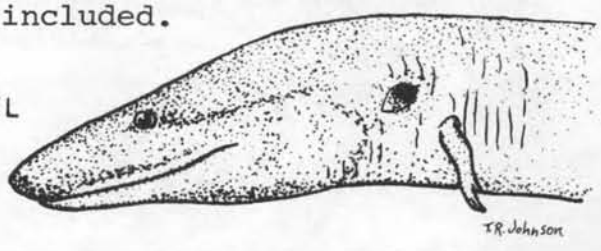
College View Motel
South U.S. 27
Oxford, OH 45056
Tel: 513-523-6311

Oxford Motel
West 27
Oxford, OH 45056
Tel: 513-523-4166

Miami Motel
West 27
5235 College Corner Pike
Oxford, OH 45056
Tel: 513-523-6306

Camping Facilities: Both Tent and Recreational Vehicle Camping Sites (350) are located five miles away at Hueston Woods State Park.

Food: The University Union has a cafeteria, an excellent restaurant and two snack bars for meals and snacks. Additionally, restaurants in uptown Oxford are only a 10 minute walk. Recreational rooms and services will also be open during the meeting, i.e., bowling, pool tables, T.V. rooms, etc.



Extra-Meeting Activities: Activities for wives and children are also being planned eg., trips to Cincinnati Zoo, Cincinnati Art Museum, etc. Additional information about activities will be included in the June issue of Herp. Review.

Exhibits:

Live animals: A display of Ohio herps will be set up in the University Center. Ohio herpetologists are encouraged to assist in developing this exhibit. Anyone who can lend Ohio herps for this purpose please contact Sheldon Guttman, Dept. Zoology, Miami Univ., Oxford, OH 45056 (Tel:513-529-4595).

Herp Art Showing: A number of people have indicated an interest in displaying paintings, and other artwork, of amphibians and reptiles at the meeting. A room has been reserved for this purpose at the University Center. Anyone who wishes to exhibit paintings, photographs, sculpture etc., please contact Douglas H. Taylor, Dept. Zoology, Miami Univ., Oxford,OH 45056 (Tel:513-529-4901) by 2 August 1976 relative to what, what size and how many items you wish to exhibit. Any information related to needs in order arrange your exhibit should also be included.

THREE-TOED CONGO EEL
1-2½ feet
(paedogenic)

REGISTRATION FORM
SSAR-HL MEETING
8-12 August, 1976
Miami University

The registration fee includes the cost of meeting rooms, social, coffee breaks, printing and mailing, chicken Bar-B-Que, etc. Pre-registration is $10.00. Registration after August 2 and at the meeting will be $12.00. ONLY send in pre-registration and group photo payments now. Pay for housing upon check-in.

ANNUAL MEETING
SOCIETY FOR THE STUDY OF AMPHIBIANS & REPTILES
and
THE HERPETOLOGIST'S LEAGUE
JOINT MEETING
Miami University, Oxford, Ohio
8-12 August, 1976

C A L L F O R P A P E R S

We expect that this will be a large meeting due to the central location of the meeting site and also since the American Society for Icthyologists and Herpetologists is meeting in Alaska in 1976. Therefore, in order to facilitate the organization of the meeting, it is necessary to set the 15th of May, 1976 as the deadline for receipt of titles and abstracts for contributed papers.

Each senior author will be limited to one paper presentation each and ordinarily will be restricted to a 15 minute time limit (which includes paper presentation and questions). An abstract of no more than 200 words must accompany this form to qualify for inclusion in the program (see other side). If an abstract is not received, the paper will be treated as a "title only" contribution.

PLEASE NOTE THE DEADLINE: 15 May, 1976
(SEE OTHER SIDE FOR ADDRESS)

(PLEASE PRINT OR TYPE)

CATEGORY IN WHICH YOUR PAPER SHOULD BE PLACED:

Anatomy ( ); Behavior ( ); General Ecology & Life History ( ); Genetics and Populations ( ); Physiology ( ); Techniques ( ); Systematics, Evolution or Zoogeography ( ); Other ( ).

Is presentation of a paper a requirement for your attendance at the meeting?_____
If yes, does this mean that you will not receive funds or time for travel if your paper is not on the program?_____

A B S T R A C T F O R M

Write abstracts in a single paragraph. Normally employ complete, connected sentences, active verbs, and the third person. Use nontextual material such as short tables and structural formulas only when no acceptable alternative exists. Employ standard nomenclature, or define unfamiliar terms, abbreviations, and symbols the first time they occur in parens; and title. The allotted space is adequate for a 200-word abstract.

SAMPLE

WORTHINGTON, RICHARD D. (Univ. Texas El Paso). Density, growth rates and home range sizes of Phrynosoma cornutum in southern Dona Ana County, New Mexico.

In the summers of 1970-72, horned lizards, Phrynosoma cornutum, were studied in a Larrea-Yucca community near Anapra, Dona Ana Co., New Mexico. In July, 1971, the density was 1.64 individuals per hectare. Preliminary data on home range size revealed large home ranges measuring up to 1.08 ha (minimum polygon method). Hatchlings were first seen in the fall and were found to increase in snout-vent (s-v) length at a rate of 0.6 mm/day during their first summer. Lizards larger than 90 mm s-v showed little subsequent growth.

USE A GOOD RIBBON AND A CLEAN TYPEWRITER. This copy will be offset directly for the published abstract.

SOCIETY FOR THE STUDY OF AMPHIBIANS AND REPTILES

The Society is pleased to announce that it will publish a facsimile of the

NATURAL HISTORY CLASSIC

NORTH AMERICAN HERPETOLOGY

by John Edwards Holbrook

147 FULL-PAGE PLATES

FIVE VOLUMES BOUND IN ONE

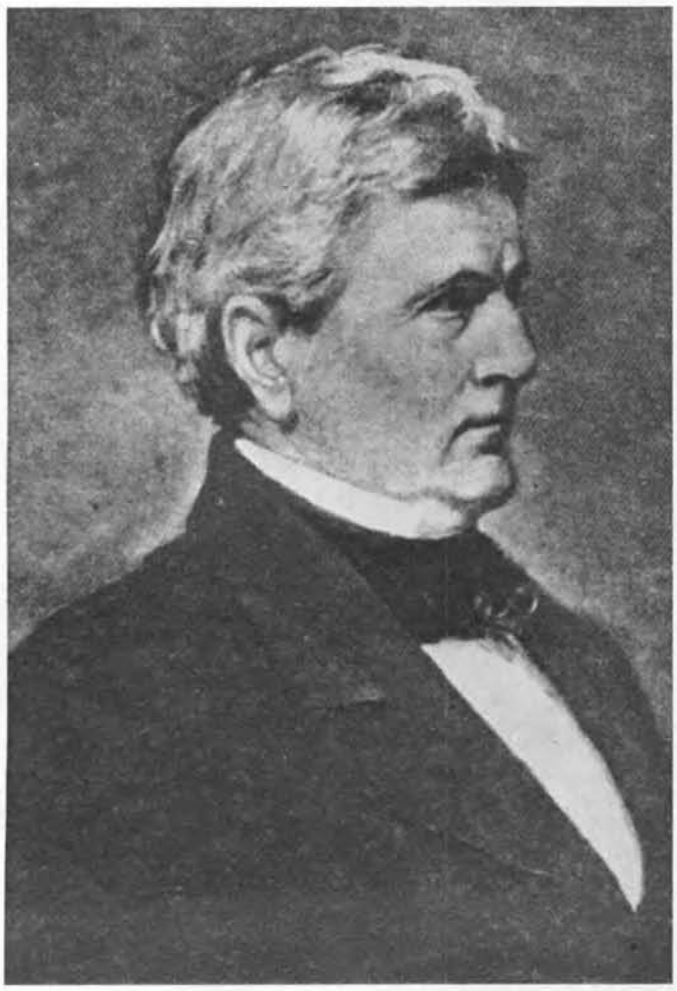
Totalling Nearly 1000 Pages

With a New Biography and Portrait of Holbrook

•

20 PLATES IN FULL COLOR

•



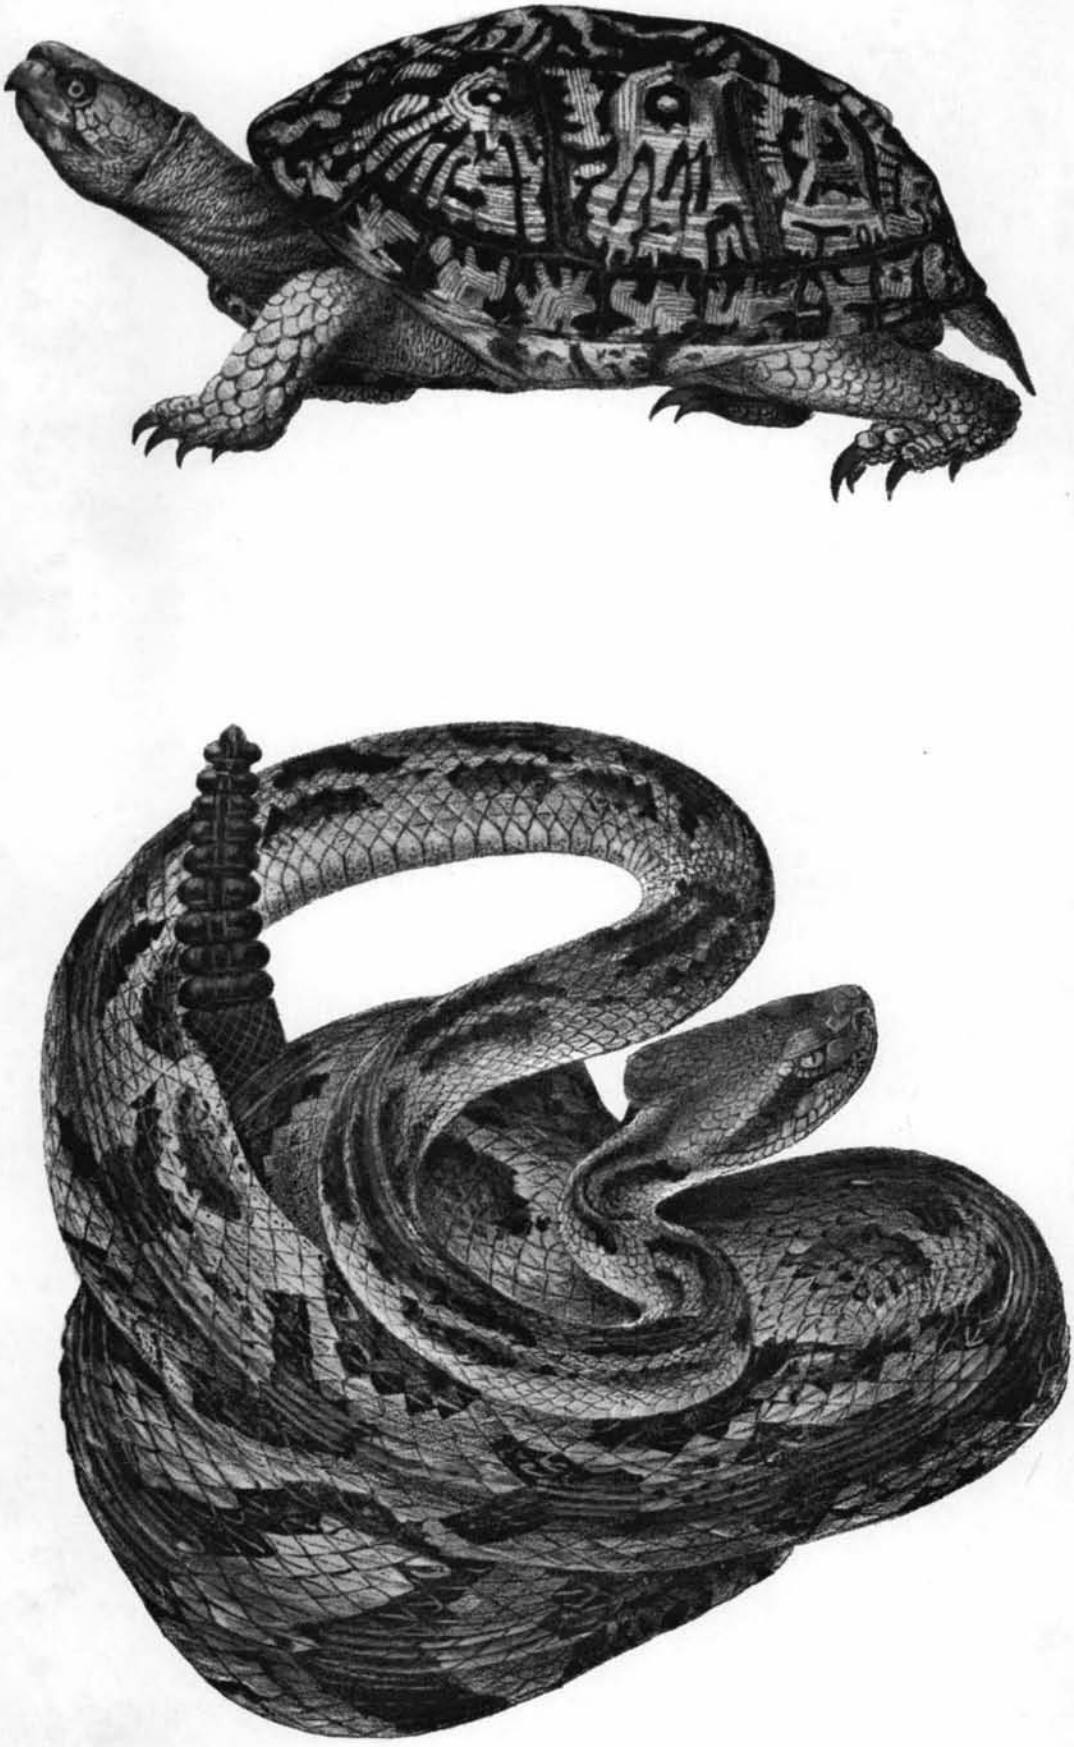
To be published October 1976

FULL DETAILS ON THE FOLLOWING PAGES

HOLBROOK'S designation as the Father of American Herpetology rests upon his major work, *North American Herpetology,* published over a century ago. Nothing surpassing it in size or beauty has ever been produced on the same subject, before or since. Holbrook's life's ambition was to publish descriptions of all known species of American fish, amphibians and reptiles, illustrated from life and in color much as his friend Audubon had done for the birds and mammals. But he surpassed Audubon in producing a beautifully-illustrated as well as scientifically-important book which, according to Agassiz, compelled Europeans for the first time to take notice of American science.

Holbrook was a physician by profession but spent most of his labor and fortune in producing his books on herpetology. He was a perfectionist and the color illustrations became an obsession with him. He employed the best wildlife artists of the day and in nearly every instance illustrated each species from living specimens. These were sent to him from all parts of the continent by his many correspondents, a veritable who's who of early American naturalists, among them DeKay, Kirtland, Harlan, Troost, Green, LeConte, Blanding, Storer and Nuttall. A first edition was issued in 1836-1840 but Holbrook became dissatisfied with it and he would sometimes refuse to send a new volume to a subscriber until the earlier one had been returned to be destroyed.

In 1842, Holbrook issued the complete second edition of his great work. This is considered the definitive edition and thus is the one being reprinted. Many plates were re-drawn and each species illustrated with a full-page plate. The text includes a detailed description of each species with sections on color, size, distribution, habits and remarks. Holbrook's style of writing is particularly lucid: referring to the diamondback rattlesnake, he said "A more disgusting and terrific animal cannot be imagined than this; its dusky colour, bloated body and sinister eyes of sparkling grey and yellow, which combine to form an expression of sullen ferocity unsurpassed in the brute creation". As Holbrook had originally intended, the book still retains its great interest both for the scientist and the serious amateur.



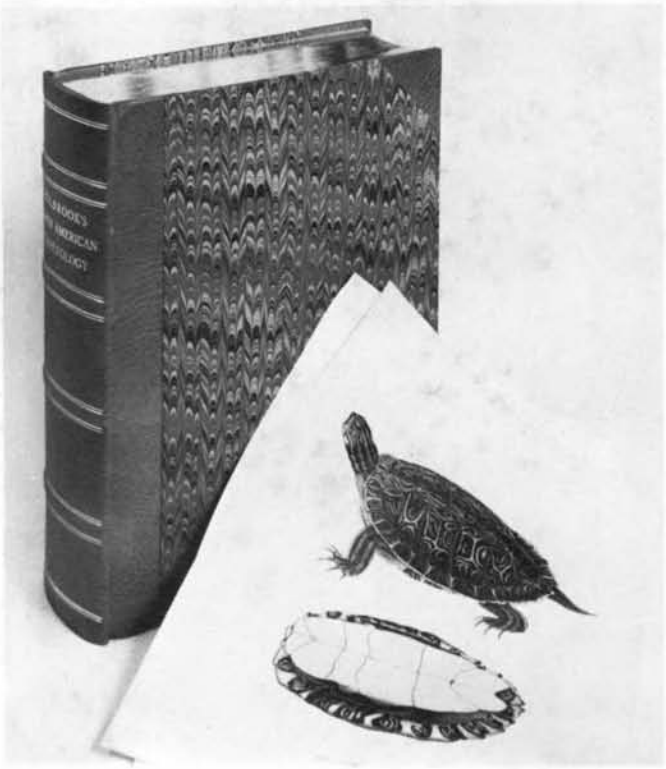
THE REPRINT EDITION. Due to the small number of copies printed and the value of the exquisite plates for framing, originals of Holbrook's magnificent treatise long ago became collector's items. These now command prices of nearly $4000 a set on the second-hand market, making it one of the most costly natural history books ever published.

The reprint will be an exact facsimile of the entire 5-volume second edition, including all 147 of the plates. Nineteen of *the best plates will be reproduced in full color* including representative snakes, lizards, turtles, frogs and salamanders. The reprint is planned to match the quality and imposing size of the original: pages will measure 8½ by 11 inches (21.5 by 28 cm), the text will be printed on special acid-free paper that lasts for centuries and the whole will be sewn and sturdily bound in heavy library buckram.

The reprint will include several unique additions. There will be a full *color portrait of Holbrook* by David M. Dennis, the well-known wildlife artist. There will also be an introduction by Professor and Mrs. Richard Worthington including a new *biography of Holbrook,* a discussion of the publication of the first and second editions of his reptile book, and a detailed tabulation equating Holbrook's terminology with modern nomenclature.

THE PATRON'S EDITION. As was common practice in those days, the costs of publishing Holbrook's books were partially borne by patrons who subscribed to them in advance. In keeping with this, a patron's edition is being offered. This special edition will be *strictly limited to only 150 copies* and is designed to become a collector's item. Each copy will be signed by the authors of the introduction and individually numbered by the editor. *A list of patrons* will be recorded for posterity on a special page in both the regular and patron's editions. Patron's copies will be richly hand bound by the eminent American book craftsmen Fritz and Trudi Eberhardt. Our intent is to duplicate the bindings of Holbrook's originals, produced at a time when binding itself was an art. These will be constructed of the finest imported materials: scarlet-red morocco leather spine and corners over genuine hand-marbled boards with 24-karat gold top edge and ornamentation. The patron's edition is illustrated on the order form.

In addition, patrons only will receive a *separate set of the 20 color plates* on oversize sheets of heavy stock measuring 10 by 13 inches (25.5 by 33 cm), unbound in a portfolio. This set includes the Holbrook portrait which will be signed, dated and individually numbered by the artist in a *limited edition of 150.* As prints for framing, these plates alone make the patron's edition an exceptional value.



DRAWINGS FROM TWO SEPARATE PLATES

ORDERING INSTRUCTIONS

Both editions consist of about 1000 pages including 147 full-page plates and a portrait, 20 of which are in full color. Page size is quarto (8½ by 11 inches, or 21.5 by 28 cm).

REGULAR EDITION: Clothbound with gold stamps. . . . . .price, $60

PATRON'S EDITION. . . . . .price, $175

This deluxe edition is strictly *limited to 150 copies* and will be issued according to the following specifications:

- Patron's copies will be hand bound to match the original bindings of Holbrook's book. These will have scarlet-red morocco leather spines and corners over genuine hand-marbled boards with 24-karat gold tops and ornamentation as well as raised bands on the spine (see photograph).
- A list of patrons will be printed on a special page in both editions. We can insure inclusion of patrons' names only if reservations are received *by the Society before July 1976.* Patron's copies will be designated on a first-come, first-served basis.
- Each copy will be signed by the authors of the introduction and individually numbered by the editor.
- Patrons will receive a separate set of the 20 color plates, printed on large sheets (10 by 13 inches, or 25.5 by 33 cm) of heavy stock suitable for framing. These will be unbound, in a portfolio.
- One of the color prints presented to patrons will be the portrait of Holbrook by David M. Dennis. This limited edition of 150 prints will be signed, dated and numbered by Mr. Dennis.

TO ORDER

Orders may be placed with your own bookseller, or directly with the Society by writing Dr. Henri C. Seibert, Morton Hall, Ohio University, Athens, Ohio 45701, U.S.A. A price-list of other books, papers and journals published by the Society together with information on membership can be obtained from Dr. Seibert.

• *SPECIAL PRICES TO SSAR MEMBERS* •

Society members can obtain substantial discounts by placing their orders directly with the Society. These should be sent to Dr. Henri C. Seibert, Morton Hall, Ohio University, Athens, Ohio 45701, U.S.A. Please make checks payable to "SSAR". Receipts sent on request only.

Individual members of the Society may purchase copies at the following reduced rates providing orders are *received by 15 August 1976.* Afterward, prices will revert to the regular rates advertised above. Please mark the edition you desire and return this order form to Dr. Seibert. Payment in advance would be greatly appreciated.

☐ **REGULAR EDITION**. . . . . .price, $ 50

☐ **PATRON'S EDITION**. . . . . .price, $150

If you order a patron's edition, please *print* below your name as you wish it to appear on the patrons' page:

_____

A DEPOSIT OF $50 IS REQUIRED FOR PATRON'S COPIES

Please *print* below the address to which your copy should be mailed:

CURRENT LITERATURE

NOTICE: The Current Literature project is now being handled by the Milwaukee Public Museum. All searchers: please note the change in address.

As of July 1974, 59 searchers are scanning a total of 408 journals.

Searchers: As the titles will be published 4 times per year, try to send your titles in at least 4 times a year to have an approximately equal listing each issue in HR.

Due to lack of space in this issue, an updated list of journals is not included. Such an updated list is scheduled for next issue, budget permitting.

Any questions, comments, etc. should be sent to:

Max A. Nickerson

CATALOGUE OF AMERICAN AMPHIBIANS AND REPTILES

(Now published by the SSAR)

****

A loose-leaf series of 2- to 4- page species accounts of the amphibians and reptiles of the Americas, with special emphasis on those in the United States and Canada. Accounts 1-150 were published from 1963 to 1972.

Binder, Taxonomic Tabs, and Accounts 1-150.

Individuals.....$ 25.00
INSTITUTIONS.....$ 35.00

Subscription to accounts 151-175 (published through no. 163 to date)

Individuals.....$ 6.00
INSTITUTIONS.....$ 12.00

Write: HENRI C. SEIBERT, SSAR

MILWAUKEE PUBLIC MUSEUM

1 December 1975

FROM THE EDITOR

The past year has been a busy and trying one for SSAR and Herpetological Review. During 1974 and 1975 we published 128 pages annually. In 1976 we will try to publish 144-152 pages (budget-dependent).

There have been some problems! Although we have published HR on schedule or no later than two weeks behind schedule, you sometimes received it months afterward. The reason for tardiness was because we shipped HR to Ann Arbor where it had to wait for other SSAR publications before shipment to you. With HR 6(2) we began individual shipment from Milwaukee. This means that the entire operation except label generation, journal scanning and initial section editing is now down at MPM. We must have considerable volunteer effort to accomplish this task. I take this opportunity to thank the following individuals who have donated their time and efforts in the production and dissemination of HR 6: Robert Henderson, Jeffrey Briggs, Sue Pleskatcheck, Teresa Noeske, Jean Rodey , Steven Yeo, Barbara Villa, Jon Shapiro, Diane Stevenson, Cheryl Castelli, Karen Slowiak, Karen Heerhold, Patricia Twinem, Nathan Kraucunas, Richard Sajdak, Craig Morrell and Gayle Davis. We extend a special thanks to Dr. Kenneth Starr, MPM's Director, for his continued support and understanding.

Happy Holidays,

M.A.N.

SSAR BUSINESS MEETING

13 August 1975

Fullerton, California

The Business Meeting of the SSAR was called to order at 11:15 a.m. by Chairman Worthington. In opening the meeting, Worthington noted that a quorum of SSAR members was not present and therefore the meeting should be viewed as informal.

Treasurer's Report: Henri Seibert stated that at least for 1976 there will be no need to increase the Society's dues. In fact, the SSAR has sufficient funds to support a number of new and innovative services for the herpetology community. For example, a translations service will be initiated under the direction of Roy McDiarmid (University of Southern Florida, Tempa); a brochure on threatened and endangered amphibians and reptiles, compiled by Ray Ashton, will be published; and a speakers bureau will be established through the Liaison Committee (Jim Murphy, Chairman). In addition, the SSAR will continue to contribute to worthwhile conservation projects and shall provide a contribution to the Zoological Record this year.

Seibert announced that the membership of the SSAR (in August) was 5.5% greater than it was at the end of last year.

Chairman's Report: Worthington stated that the Board had met for eight hours on Sunday, 10 August, at which time a number of decisions were made. [Copies of the Board Meeting minutes are available upon request from the Secretary: Stephen R. Edwards/ Association of Systematics Collections/ Museum of Natural History/ University of Kansas/ Lawrence, Kansas/ 66045.]

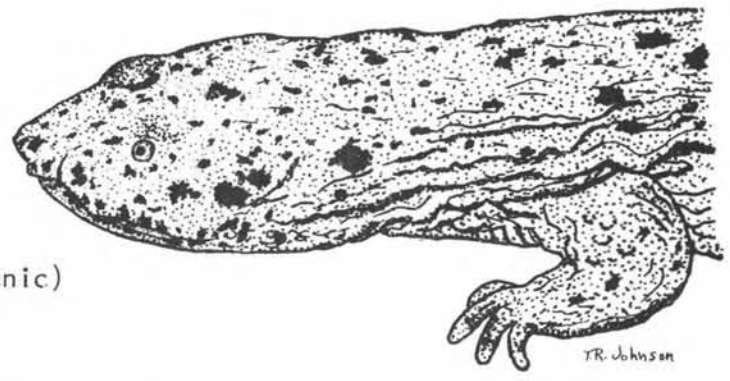
Of particular interest, the Board approved the 1977 meeting site at the University of Kansas, Lawrence; the budget for the Journal of Herpetology was increased by 15%; and, the Facsimile Reprint Series will undertake publication of Holbrook's "North American Herpetology, 2nd Edition" and McIlhenny's "The Alligator's Life History."

The Student Prize for 1975 for the best student paper published in the Journal of Herpetology was awarded to Eliezer Frankenberg for his paper entitled "Vocalization of Males of Three Geographic Forms of Ptyodactylus from Israel," J. Herp. 8(1):59-70. The prize carries a $100.00 award.

Nominating Committee Report: Worthington reported that the ballots for the election of officers and directors for 1976 will be distributed in September. The Nominating Committee has proposed the following candidates: Chairman-Elect, W. Ronald Heyer and Max A. Nickerson; Secretary, Stephen R. Edwards; Treasurer, Henri C. Seibert; Board Members (two of which will be elected) Robert L. Bezy, Laurence M. Hardy, Harry W. Greene, and Richard R. Montanucci. No additional nominations were offered from the floor.

Worthington stated that the Board has proposed that the By-laws be amended to increase the number of Directors from four to six. Ballots for this amendment will be distributed with the ballots for the election of officers and directors. If this amendment passes, the change in the number of directors will take effect in 1977.

In other matters, Worthington noted that the Secretary has been charged with evaluating the pros and cons of securing corporate status for the SSAR during the next year.



John Applegarth presented the following resolution which was adopted unanimously by those in attendance:

> For their help and hospitality which has made this meeting a success, the Society for the Study of Amphibians and Reptiles and the Herpetologists' League jointly express their most sincere appreciation to the local committee chaired by William Presch and John W. Wright and staffed by Andy Hughes, Joel Weintraub, Lou Mitchell, Mick Bondello, Ron Whiteman, Carl Babb, Doug Allan, Al Romspert, Jim Lacky, Becky Papendick, Curt Gage, and Robert Bezy and the institutions of California State University at Fullerton and Pacific Christian College.

Respectfully submitted,

Stephen R. Edwards

SSAR/REGIONAL SOCIETIES INTERACTION

With the publication of Herpetological Circular No. 4 (mailed with J. Herp. 9 (4)),. SSAR has taken a major step towards uniting the herpetological community's resources to advance the discipline as a whole. In June 1975, I presented a proposal for financial interaction between SSAR and regional societies to the SSAR Liaison Committee. This proposal was based upon the beliefs that:

1) regional societies may sometimes wish to undertake very worthwhile herpetological projects, but may be prevented from so doing by very limited finances;
2) combined, the regional societies represent a considerable intellectual and financial herpetological resource;
3) while national and international societies'financial bases are relatively large, they are distinctly, finite.

I felt that some potentially valuable herpetological goals were being restricted by limited funds, and had an example at hand.

The Kansas Herpetological Society, while not condoning the capture and sale of reptiles for pets, does recognize that these animals constitute popular and legitimate trade items. KHS felt it futile to try to totally restrict such trade, and indeed recognizes that many current "professional" herpetologists began by keeping and observing their own live collections while youngsters. Therefore, we desired to make a strong effort to improve the fate of captive reptiles maintained by private individuals, schools, and pet shops. A manuscript submitted to Herpetological Circulars appeared to be a very positive step in the direction KHS wanted to go. It was comprehensive in its coverage of ailments most commonly afflicting reptiles maintained by individuals, schools and pet shops; it was in a concise outline form and hence readily followed by the layman; it was brief enough to be marketed cheaper than any similar publication. KHS felt that if it could cosponsor the publication with SSAR, KHS could accomplish an objective which would otherwise be financially beyond it and SSAR would be able to put any money saved towards other worthwhile projects. Hence, the above-mentioned proposal was born.

Realizing that most regional societies no doubt faced the same problems, the proposal was phrased in general terms, using the desired KHS/SSAR interaction as an immediate example. At its annual meeting, SSAR's Board of Directors accepted the working principles of the proposal on a trial basis. Herpetological Circular No. 4 went to press shortly thereafter. SSAR and KHS are indebted to Ms. Mary Makepeace (1320 Valley Land, Lawrence, KS) for her help in preparing Herp. Circ. No. 4 and cover designs.

The possible range of projects which could be cosponsored is very broad, and simultaneously is regulated by relative merit of specific proposals, SSAR priorities and available funds. Interested societies are urged to direct inquiries to James B. Murphy, Chairman -- SSAR Liaison Committee -- Dallas Zoo -- 621 E. Clarendon Drive -- Dallas, Texas 75203.

PRELIMINARY LIST OF REGIONAL HERPETOLOGICAL SOCIETIES

The SSAR, through the efforts of the Liaison Committee, is attempting to establish a much closer relationship with regional herpetological societies. In order to accomplish that end, questionnaires were sent to all of the societies for the purpose of compiling a current list and to gain some input as to how SSAR might be of greater assistance to regional societies.

The Committee members, Stanley Dyrkacz, Tom Johnson, Gopher Kuntz, Michael Long and Malvin Skaroff, prepared questionnaires which covered the following topics: status of the society, hierarchy of the organization, membership, publications, frequency of meetings, and other pertinent information. The response was less than overwhelming and the list reflects the amount of information that was returned. The status of many societies could not be determined so any corrections or additions would be welcome. Please send all information to:

James B. Murphy, Chairperson
SSAR Liaison Committee
621 E. Clarendon Dr.
Dallas Zoo
Dallas, TX 75203

When additional information is gathered, a revised list of societies will be published.

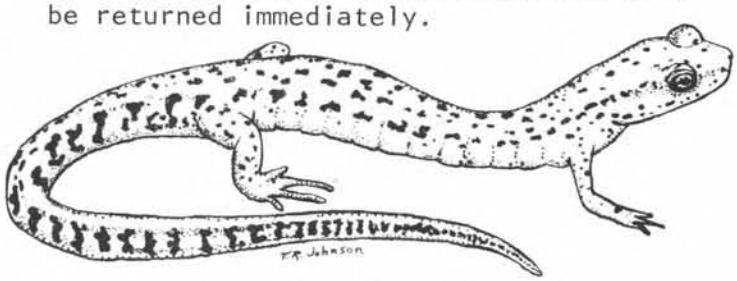
"WELL, GUESS WHERE HIS SNAKE GOT AWAY TO THIS TIME!"

BOOK REVIEW

Borner, Achim-Rüdiger. 1972. Revision der Geckonidengattung Phelsuma Gray, 1825. Privately printed. 145 pp., 5 figs., 5 pls., (obtainable from the author at 5 Cologne 41, Zülpicherstr 83, West Germany. 30 DM unbound, 45 DM bound. The main thrust of this revision is the abandonment of keeled ventrals as a significant taxonomic character. Instead, Borner uses the position of the nostril thereby making it possible to recognize two subgenera: Archaeophelsuma, having the nostril above the suture between the rostral and first labial, and Neophelsuma, having the nostril above the first labial only (the genus Archaeophelsuma becomes amended to Phelsuma in the errata).



There is a key to the species and subspecies of the genus and a phylogenetic chart which is somewhat difficult to unravel; I am uncertain of the evidence upon which it is based. Thereafter follows the distribution of each taxon (23 sp. and 18 ssp.), a list of localities and Phelsuma to be found therein, plus maps showing the distribution of the various Madagascan species. A synonymy, through 1970, is provided followed by a major section devoted to the description of each form. Additionally, there is a list of suggested "standardized" German common names, a bibliography and a cross-referenced index.

I am not sufficiently familiar with the lizards to comment on the validity of the revision. Editorially, I would say that there is much repetition and that the work could have been condensed by half. What effect a private publication will have on the acceptance of two new subgeneric names and other changes in nomenclature brought about by the change in status of 11 of the taxa, I won't presume to guess. However, all Phelsuma students must become aware of this publication.

Henri C. Seibert

HERPETOLOGICAL SPEAKERS BUREAU →

In order to facilitate the process of locating speakers for herpetological societies and other organizations, a nationwide herpetological speakers bureau has been established by the SSAR. Those speakers who wish to be listed as available for this purpose should fill out the enclosed questionnaire and return immediately. Should a speaker be required, contact James Murphy and describe generally the type of program that is desired. A list of available speakers, within the area, with pertinent information as to the presentation will be returned immediately.

Long-tailed salamander

****

SSAR ELECTION RESULTS

****

As a result of the recent SSAR election, the following people have been elected:

MAX A. NICKERSON (Chairman-Elect)
HENRI SEIBERT (Treasurer)
STEPHEN R. EDWARDS (Secretary)
HARRY W. GREENE (Director)
RICHARD R. MONTANUCCI (Director)

The proposed amendment to provide six directors on the Board passed: 281 for; 29 against.

To facilitate the election process next year, ballots will be distributed by first class mail.

NEW LEASE OF LIFE FOR DARWIN'S GIANT TORTOISES

Morges, Switzerland - Giant Galapagos island tortoises raised under protection from predators which have prevented them reproducing successfully for many years, are now being reintroduced and are thriving in their natural homes, according to a report received by the World Wildlife Fund.

The tortoises, which differ in form from island to island, are among the Galapagos animals which provided Charles Darwin with living evidence of evolution. Goats, pigs, rats, dogs, cats, donkeys and cattle introduced by man have threatened their survival by destroying eggs and young and competing for available food supplies. No young of some subspecies had grown to maturity for over 60 years.

The Charles Darwin Research Station which has international support, has been protecting tortoise nests by building rock walls around them or putting wire netting over the eggs. The eggs are removed when about to hatch and the young are raised at the Station.

The former Director of the Station, Dr. Peter Kramer, states: "Repatriation of young Pinzon tortoises started in December 1970. So far 80 young, which had been kept for four or five years at the Station, have been repatriated to Pinzon. They were observed at regular intervals and were found to be in very good condition."

Eight subspecies of tortoise from various islands are being raised at the Darwin Station. During the searches for breeding areas on the islands scientists found a few survivors of the Pinta subspecies which was believed extinct, and it is hoped to build up a protected breeding stock.

Some tortoises are still killed by the crews of fishing vessels from the South American continent, and there is evidence that small tortoises are being taken illegally for sale to animal dealers.

Apart from the breeding programme, the Darwin Station, in association with the authorities of Ecuador, which has sovereignty over the Galapagos islands, is controlling and eliminating introduced predators where possible. Goats have been totally eliminated on Santa Fe and Rabida, and reduced elsewhere. Pigs are being kept to minimum numbers. But no effective method of dealing with dogs and cats, which are threatening sea lions, and land and marine iguanas, as well as tortoises, has yet been found.

WORLD WILDLIFE FUND

PHILODRYAS OLFERSI (LICHENSTEIN) NEW TO COLOMBIA AND VENEZUELA

The range of Philodryas olfersi (Lichenstein) as presently understood extends latitudinally from northern Argentina to north of the Amazonian Basin in Brazil, Surinam, and French Guiana, and longitudinally from the eastern slope of Peru east to the Atlantic coast (Fig. 1, hatched area). The northernmost reported locality is Charlottenburg, Surinam (Brongersma, 1957). An examination of museum material of this genus from northern South America reveals the existence of P. olfersi in Colombia and Venezuela.

Recent compendia of the snakes of Colombia (Niceforo Maria, 1942; Gunn, 1944; Daniel, 1949, 1955; Medem, 1968) reported viridissimus (Linnaeus) as the only Philodryas known from that country. A series of that genus (UTA-R 3543-44, 3547, 3552, 3655) arising from field work coordinated by W. F. Pyburn in the vicinity of Lomalinda (ca. 10 km N Puerta Lleras), Estado Meta, represent the first reported specimens of P. olfersi from Colombia and the first verified from the Llanos region.

Roze (1966, 1970) listed two species of Philodryas from Venezuela: carbonelli Roze and viridissimus. Specimens of P. olfersi examined by us are from several closely approximated localities in the tropical rainforest region of the Alto Rio Ventuari, Territorio Federal Amazonas (MCN 786, 852, 944, 1863, 4037) and from Mata de Cuchillo (between Sta. Elena de Uairen and Paurai-Tepui), Estado Bolivar, situated in the Gran Sabana area (MCN 5017). Another specimen (ZIMH 3708 bears the label "Laguayra, Venezuela", which may refer to the port city of La Guaira (an unlikely locality for olfersi since it is north of the Cordillera de La Costa) or Cerro La Guayra in western Estado Bolivar. If the data refers to the former locality, it would undoubtedly indicate the point of dispatch. The latter locality is situated near the Rio Orinoco in the Llanos and could be the collection site. It is surprising that the presence of this species in Venezuela has been overlooked since the MCN specimens were collected in 1960 and the ZIMH specimen prior to that time.

The specimens reported above agree well in meristic and mensural characteristics with over 400 specimens of P. olfersi which we have examined from other parts of the range.

We wish to thank H. W. Greene, University of Tennessee; W. Ladiges, Zoologisches Staatsinstitut Zoologisches Museum, Hamburg (ZIMH); A. R. Lancini V., Museo de Ciencias Naturales, Caracas (MCN); and W. F. Pyburn and J. L. Darling, University of Texas at Arlington (UTA-R) for the loan of specimens and other information.

BOOK REVIEW

Deuchar, Elizabeth. 1975. Xenopus: the South African clawed frog. John Wiley and Sons, New York. $29.50. X + 246 pp.

In many laboratories Xenopus has replaced Rana as an experimental animal, and a textbook on its anatomy and physiology has become a necessity. The present volume fills this need and will help make Xenopus as well known to the general biologist as Rana, Necturus, or Salamandra.

The first chapter describes the species of Xenopus and their natural habitat. This is one of the shorter and weaker chapters in the book and it is obvious that the author is not on "intimate" terms with systematics or ecology. The second chapter is devoted to anatomy, with emphasis on special features as contrasted to other amphibia. Chapter three is entitled "Physiological studies on Xenopus". However, most research has been on reproductive physiology, principally because of interest generated by its ready response to injections of gonad-stimulating hormones. The next seven chapters deal with gametogenesis, fertilization, embryogenesis, cleavage, gastrulation, organogenesis and with examples of precision work on the control of later events in development, regeneration, immunogenesis, etc.

There is an index and an extensive bibliography, brought up to date (1974) even while the manuscript was in proof. The book is profusely illustrated. Its greatest value will be to the embryologist or experimental morphologist with lesser import to the ecologist and systematist.

-- Henri. C. Seibert, Dept. of Zoology, University of Ohio, Athens, Ohio.

HERPETOLOGICAL "LIFE LIST"

Somewhere in the near future the SSAR will be publishing a checklist of US herpetofauna with both common and scientific names. I would like to suggest to those who are interested that this list be used for a "life list" with judge). If you observe a living example of a particular species in the wild and make no effort to collect it (it is OK to move it a bit for a photograph or positive identification) then you may check that species in the page margin. The key idea is you make no effort to remove it from its wild state. Animals you collect, attempt to collect or see in captivity do not count.

Durango, CO 81301

AUSTRALIAN FROG CALLS AVAILABLE

The calls of 44 of the 75 recognized forms of frogs inhabiting S. E. Queensland, N.S.W., Victoria, Tasmania and S. E. South Australia have been recorded on casette and reel-reel tapes. The one-hour recordings include an introduction and general commentary. The calls are grouped by geographic regions. Contact: Gordon Grigg and John Barker, Zoology Dept., Univ. of Sydney, Sydney, N.S.W. 2006, Australia.

EASTERN SEABOARD HERPETOLOGICAL LEAGUE MEETING

The next ESHL meeting will be held 6 March 1976 at the Rohm & Haas Bld. Auditorium at Independence Square West in Philadelphia.

A NEW METHOD FOR TRAPPING SOFTSHELL TURTLES

We have found that the usual methods for trapping softshell turtles (Trionyx sp.) are often unreliable and inefficient. Breckenridge (1955) reported the best results with hoop nets, but his drop net was unsuccessful.

We constructed a rectangular net (5 m x 2 m) from No. 24 nylon cord (Fig. 1). A pore diameter of 6-8 cm allowed the net to be pulled rapidly out of the water. One long side of the net was staked to the bank at 15 cm intervals and about 30 cm above the water. Plastic rings (ca. 5 cm diameter) and weights were attached to each end and the center of the opposite side which sank in the water. Steel rods (4 m x 1-3 cm), inclined toward the bank at about a 45° angle, extended through the rings and into the river bottom. Lines extending from the plastic rings through similar guide rings at the top of the rods were joined to a common pull cord that extended to a blind.

While turtles were basking on the bank, the main cord was pulled enough to raise the submerged edge of the net about 0.5 m out of the water and form a U-shaped net. At the first sign of net movement, the turtles ran into the water and swam downward into the net. It was then pulled to the bank and turtles were untangled from the net by hand.

The turtles showed no fear of the net although it often took them some time to make their exit from the water. They did not attempt to avoid the net during their escape rush, and individuals returned the following day. Occasionally, smaller turtles escaped through the net. This method should be equally successful with other species that bask on land.

THE THEODORE ROOSEVELT MEMORIAL FUND

The Theodore Roosevelt Memorial Fund provides financial assistance to individuals (especially graduate students and persons with recent graduate degrees) conducting research in North America in any phase of wildlife conservation or natural history related to the activities of the American Museum of Natural History. Grants are usually kept to small sums of not more than several hundred dollars. Most awards support field work, and funds are not made available for salaries or for the purchase of non-expendable equipment. Address requests for application forms and all correspondence to:

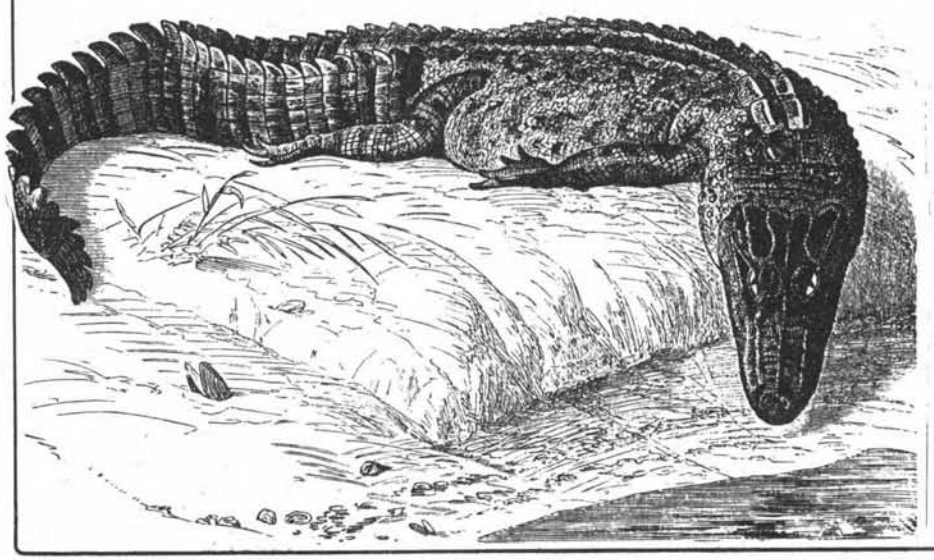
Theodore Roosevelt Memorial Fund
The American Museum of Natural History
Central Park West at 79th St.
New York, New York 10024

Deadline for application is 15 February.

SOCIETY FOR THE STUDY OF AMPHIBIANS AND REPTILES

McIlhenny's
The Alligator's Life History

125 pages, 18 full-page photographs, portrait, originally published Boston, 1935



WITH A NEW PREFACE BY ARCHIE CARR (University of Florida)

Although published forty years ago, this classic is still the most complete record of the natural history of North America's most distinctive reptile. The book is based on personal observations made over a lifetime of intimate association with the alligator in its native habitat. There are chapters on facts and myths, habitat, dens and hibernation, food and growth, voice, nest building and incubation, and enemies. In view of the endangered status of crocodilians internationally and their important phylogenetic position, McIlhenny's account will continue to provide a wealth of basic information for evolutionary, behavioral and ecological studies.

to order

Orders may be placed now. The book will be published in Spring 1976; to take advantage of special prices, *SSAR members must place their orders before publication.* Please mark the edition you desire and send with payment to Dr. Henri C. Seibert, Morton Hall, Ohio University, Athens, Ohio 45701, USA. Make checks payable to "SSAR"; receipt sent on request only.

Mark these boxes if you want information on SSAR membership ☐ or a complete list of Society publications ☐.

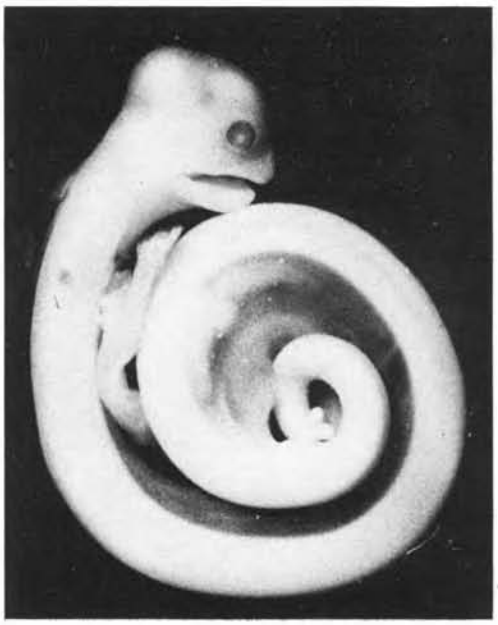
THE BIOLOGY OF SEA SNAKES

Edited by
William A. Dunson, Ph.D.,

Professor of Biology,
The Pennsylvania State University

This richly detailed, extensively documented volume reflects the importance now being given to scientific studies of the sea and the special attention being given to sea snakes — the most successful living group of marine reptiles, in spite of their rigorous, hard-to-colonize habitat.



In addition to providing the most extensive, thorough review ever published on the general biological aspects of sea snakes, this book includes a wealth of data and knowledge obtained from two unique expeditions involving an international group of scientists carrying out detailed experimental studies on sea snakes. The expeditions were organized by Dr. Dunson, joined by ten of the other contributors to this volume.

THE BIOLOGY OF SEA SNAKES emphasizes the unusual features of sea snake adaptation — their tropical distribution, their venomous nature and the protection this gives them from predators, their feeding behavior and diving physiology, and their ability to regulate body fluid salt content. An entire chapter is devoted to the life history of a specialized barnacle found only on the skin of sea snakes.

The book also covers the evolution and taxonomy of the Australian species, together with such controversial topics as attacks on divers and possible migration through the proposed Atlantic to Pacific sea level canal. Other subjects include the epidemiology and clinical aspects of sea snake bites and a description of the unique Philippine commercial sea snake fisheries.

Except for the almost wholly taxonomic 40-year old classic, *Monograph of the Sea-Snakes* by Malcolm Smith, this is the only book on sea snakes published in this century. It is an essential reference for all marine biologists, biological oceanographers, and herpetologists, including advanced undergraduate and graduate students. In addition, it provides fascinating reading for all scientists and everyone interested in ecology, natural history, and the environment.

550 pages Profusely illustrated 1975 **$34.50**

GALAPAGOS TORTOISE HATCHES AT PHILADELPHIA ZOO

On 20 September 1975 at the Philadelphia Zoo, a Galapagos tortoise (Geochelone elephantopus) began to hatch after an incubation period of 200 days at a temperature of 26.7°C. After unsuccessful attempts to break through the shell, the hatchling was removed from the egg on 23 September. The hatchling weighed 77.6 g., and the straight-line carapace length was 67.6 mm.

The last observed copulation between the parents occurred on 8 January, 1975 at 0715 hours, and a clutch of nine eggs were laid in an excavated sand nest on 5 March at 0900 hours. Four eggs were broken in the nest. Of the five eggs placed in the incubator, three proved to be fertile. One fertile egg, which was opened on 25 July, contained a live embryo. The third egg was opened on 1 October, and it contained an embryo, which had been dead for approximately four weeks.

The male parent came to Philadelphia in 1946 as a gift from the New York Zoological Society. It was from one of the herds of Galapagos tortoises which were maintained by that Society in southern Florida. This male is one of the specimens collected by Dr. Charles H. Townsend (NYZS) on southern Albemarle (Isabela) in 1928.

The female parent is a captive bred tortoise which hatched at the Bermuda Government Aquarium and Museum in 1940. It is interesting to note that this female is an offspring of stock collected on that same Townsend Expedition. For these reasons the hatchling is probably representative of the nominate race Geochelone elephantopus elephantopus.

J. Kevin Bowler
Curator of Reptiles

CONSERVATION NEWS

Two national parks are being planned by the government of Peru. They will cover an area of about 3800 square miles in the Amazon Basin.

UPI in the Milwaukee Journal

Costa Rica has declared 72,000 acres a national biological preserve. The site is on the Osa Peninsula, 90 miles south of San Jose, Costa Rica's capital. Scientists have observed 42 species of frogs and 19 of lizards in the area.

NY Times

"The California Fish and Game Commission has placed tight restrictions on commercial trade in the state's amphibians and reptiles.....The use of frogs is already regulated.

"The new regulations prohibit the taking, transporting, exporting, importing and sale for commercial purposes of most native reptiles and amphibians."

OUTDOOR CALIFORNIA
September-October 1975

National Audubon workers are transplanting 1000 American alligators from Louisiana to parts of its range where it has been eliminated. The National Audubon Society suggested this practice rather than allowing the surplus alligators to be hunted for their hides.

Audubon Magazine
Sept. 1975

In June, Ricky Chambliss and Donnie Davis killed a 10 ft. alligator near Eagletown, Oklahoma. For their efforts they each received a fine of $115 and a suspended 30 day jail sentence.

GEOGRAPHIC DISTRIBUTION

HERPETOLOGICAL REVIEW publishes brief notices of new geographical records in order to make them available to workers in published form. The STANDARD FORMAT for a record is:

SCIENTIFIC NAME (Common name). Locality (air-line distance to nearest town); date; collector. Identified or verified by. Place of deposition and catalogue number. Comments. SUBMITTED BY. address.

Please submit new records in STANDARD FORMAT (short manuscripts are acceptable when data cannot be adequately presented in standard format) to Joseph C. Mitchell, Dept. of Zoology, Arizona State University, Tempe, Arizona 85281.

Recommended citation: Jones, J. 1974. Geographic Distribution: Rana pipiens. Herp. Rev. 5(1):1.

CAUDATA

AMBYSTOMA ANNULATUM (Ringed salamander). U.S.A., Arkansas, Sharp Co., 3.8 km SW Ash Flat; 3 May 1975; B. Richards. V. Rick McDaniel. Arkansas State University Zoological Collection, ASU 1678. Eastward extension of known range from western Arkansas into northern portion of East-central Arkansas (Conant, 1975, A Field Guide to Reptiles and Amphibians of Eastern and Central North America, Houghton Mifflin Co.). Submitted by V. RICK McDANIEL, Division of Biological Sciences, Arkansas State University, State University, ARK 72467.

AMBYSTOMA TEXANUM (Small-mouthed salamander). U.S.A., Oklahoma, Garfield Co., 10.3 km SE Covington; 5 Aug. 1972; 14.3 km SE Covington; 20 Jan. 1975; Vance AFB Military Housing Area, 3.5 km SW Enid; 26 Oct. 1974; R. L. Lardie. Collection of R. L. Lardie, RLL 772, 1325, 1251, respectively. Extends range 40, 41 and 71 km NW of nearest Oklahoma records in Payne Co. (Oklahoma State University A 921, 922) and represents first county records. Submitted by RICHARD L. LARDIE and BRYAN P. GLASS, Dept. of Biological Sciences, Oklahoma State University, Stillwater, OK 74074.

SALIENTIA

BUFO BUFO (Common toad). IRAN, Mazandaran Province, 20 km SSE Sari; 21 May 1975; R. G. Tuck, Jr. R. G. Tuck, Jr. and S. C. Anderson. Muze'-ye Melli-ye Tarikh-e Tabi'i, Tehran, Iran, MMTT 745-746. First records for province and first adult specimens known from Iran. Previously known in Iran only from 2 juveniles taken 10 km W Ramsar, Gilan Province (Eiselt, J., 1973, Ann. Naturhistor. Mus. Wein, 77:181-243). Submitted by ROBERT G. TUCK, JR., Curator/Advisor, MMTT, Dept. of the Environment, P.O. Box 1430, Tehran, IRAN.

HYLA CRUCIFER CRUCIFER (Northern spring peeper). U.S.A., Michigan, 23.5 km NE Seney, Luce Co., T 47 N, R 12 W, Sec. 17, NE 1/4, NE 1/4, 4 May 1975; R. L. Eckloff and M. B. McCune. J. K. Werner. Northern Michigan Univ. Mus. Zool., NMZ 86.1 - .8. First record for county. Keweenaw Co., 15.7 km NW Gay, T 56 N R 31 W, Sec.6, NE 1/4, NE 1/4; 8 May 1975; M. B. McCune. J. K. Werner. NMZ 84.1 - .10. First record for county. H. crucifer is now recorded from all Upper Peninsula, Michigan counties. Submitted by M. B. McCUNE and R. L. ECKLOFF, Dept. of Biology, Northern Michigan University, Marquette, MI 49885.

TESTUDINES

CHELYDRA SERPENTINA (Snapping turtle). U.S.A., New Mexico, Mora-Harding Co. boundry; 15.2 km WSW Roy; 25 June 1975; M. E. Seidel. University of New Mexico, Museum of Southwestern Biology, UNM 30513. New county record and extension of range 69 km NW in the Canadian River

(Degenhardt and Christiansen, 1974, SW Nat., 19(1):21-46. Submitted by MICHAEL E. SEIDEL, Dept. of Biological Sciences, Marshall University, Huntington, W. VA 25701.

CHRYSEMYS FLORIDANA HOYI (Missouri slider). U.S.A., Oklahoma. Garfield Co., 3.2 km SW Enid; 6 Aug. 1975; C. Hammond and E. Lusky. Collection of R. L. Lardie, alive. Extends range 79 km W of nearest Oklahoma record and first county record (Webb, 1970, Reptiles of Oklahoma, University Oklahoma Press). Submitted by RICHARD L. LARDIE, Dept. of Biological Sciences, Oklahoma State University, Stillwater, OK 74074.

CHRYSEMYS SCRIPTA ELEGANS (Red-eared turtle). U.S.A., New Mexico, San Miguel Co., Canadian River, 0.5 km WNW Sabinoso; 4 July 1975; M. E. Seidel. University of New Mexico, Museum of Southwestern Biology, UNM 30514. Extension of range 39.1 km NW of previous NW range limit (Degenhardt and Christiansen, 1974, SW Nat., 19(1):21-46). Submitted by MICHAEL E. SEIDEL.

SAURIA

HEMIDACTYLUS MABOUIA (African wall gecko). BRITISH WEST INDIES, Grand Turk Island near airport: South Caicos Island, Cockburn Harbour; 21-23 June 1975; M. R. Minton and S. A. Minton. Collection of S. A. Minton, SAM 1409 and 3 live specimens. First records for species from Turks and Caicos Islands. Submitted by MADGE R. MINTON and SHERMAN A. MINTON, Indiana University Medical Center, Indianapolis, IND 46202.

SERPENTES

CONIOPHANES FRANGIVIRGATUS (Peter's black-striped snake). MEXICO, San Luis Potosi, 20 km N Ciudad Valles; 19 Dec. 1974; M. R. Minton and S. A. Minton. Collection of S. A. Minton, SAM 1393. First record for state of San Luis Potosi; third for species. Submitted by BROOKS MINTON DE CERVANTES, Angela Peralta 20, Queretaro, Qro., Mexico and SHERMAN A. MINTON, Indiana University Medical Center, Indianapolis, IN 46202.

MICRURUS FULVIUS MICROGALBINEUS (Tamaulipan coral snake). MEXICO, Queretaro, Cimatario, 4 km S Queretaro, elevation about 2000 m.; Sept. 1974; collector unknown. Collection of S. A. Minton, SAM 1390. First record for plateau region of Queretaro and probable altitude record for the species. Submitted by BROOKS MINTON DE CERVANTES and SHERMAN A. MINTON.

STORERIA DEKAYI LIMNETES (Marsh brown snake). U.S.A., Texas, Webb Co., Laredo; 16 July 1975; B. M. Burr. M. A. Morris. Illinois Natural History Survey, INHS 10206. County record and southwestern range extension along Rio Grande (Raun and Gehlback, 1972, Amphibians and Reptiles in Texas, Dallas Mus. Nat. Hist.). Submitted by BROOKS M. BURR and MICHAEL A. MORRIS, Illinois Natural History Survey, Urbana, ILL 61801.

THAMNOPHIS SIRTALIS ANNECTENS (Texas garter snake). U.S.A., Oklahoma, Ellis Co., tributary of Wolf Creek, 2.5 km N Fargo; 28 June 1975; R. L. Lardie. Collection of R. L. Lardie, alive. Establishes presence in Oklahoma. Disjunct populations are known in the Texas Panhandle and Meade Co., Kansas (Fitch and Maslin, 1961, Univ. Kansas Publ. Mus. Nat. Hist., 13(5):289-308). See also Conant (1975, A Field Guide to Reptiles and Amphibians of Eastern and Central North America, Houghton Mifflin Co.). This specimen represents an extension of 78 km eastward of the Texas Panhandle population. Submitted by RICHARD L. LARDIE.

THAMNOPHIS SIRTALIS PARIETALIS (Red-sided garter snake). U.S.A., Arkansas, Lawrence Co., Imboden; April 1975; F. E. Campbell. V. R. McDaniel. Arkansas State University Zoological Collection, ASU 1679. Eastward extension of known range from Southwest Missouri to northern portion of East Arkansas (Conant, 1975, A Field Guide to Reptiles and Amphibians of Eastern and Central North America, Houghton Mifflin Co.). Submitted by V. RICK McDANIEL and WILLIAM W. BYRD, Division of Biological Sciences, Arkansas State University, State University, ARK 72467.

TYPHLOPS BRAMINUS (Brahminy blind snake). MEXICO, Queretaro, Queretaro; July 1971 and November 1972; Brooks Minton De Cervantes. Collection of S. A. Minton SAM 1185 and 1240, respectively. First record for Mexican plateau. Submitted by BROOKS MINTON DE CERVANTES and SHERMAN A. MINTON.

RECORD SIZE PHRYNOSOMA DOUGLASSI

Phrynosoma douglassi. Conant (1975, A Field Guide to Reptiles and Amphibians of Central and Eastern North America, Houghton Mifflin Co.) records a record size P. douglassi hernandesi having a SV length of 109 mm and total length of 149 mm. Kerfoot (1962, Southwest Nat. 7:78-79) reported a giant specimen of P. douglassi ornatissimum from Colorado having the following measurements: SV, 104 mm; tail, 45 mm and width at mid-body, 62 mm. On 26 May 1975 I collected a female P. douglassi hernandesi on the western slope of the Dos Cabezas Mountains, Cochise Co., Arizona measuring 112 mm SV, 47 mm tail, 70 mm width at mid-body and 159 mm total. It was a mixed rocky and sandy area dominated by Prosopis - Opuntia - Acacia vegetation. This individual contained 33 oviducal eggs, three more than recorded by Fitch (1970, Univ. Kansas Mus. Nat. Hist., Misc. Publ. 52: 1-247) but less than the 48 maximum reported by Howard (1974, J. Arizona Acad. Sci. 9:108-116). The specimen is deposited in the author's collection (JCM 330). I thank M. J. Fouquette, Jr. and S. R. Wylie for criticizing this note.

AN ENCLOSURE DESIGN FOR STUDYING TERRESTRIAL SALAMANDERS

During an ecological study of salamanders a necessary modification of Jaeger's (1971) enclosure method was developed. Six enclosures were built of aluminum screen (1 mm mesh). The top was left open to permit natural litter deposition and the upper edge of the screen was folded inward in an inverse U-shape to prevent the salamanders from escaping. Individuals of Plethodon cinereus were placed in the enclosures in early May and checked five days later. In the interim other P. cinereus as well as a Gyrinophilus porphyriticus had entered the enclosures. The Gyrinophilus had apparently depredated the original stock of animals since no P. cinereus remained in the enclosure it entered.

While the design adequately prevents egress by the study animals, it does not prevent ingress of salamanders. To rectify this, strips of screen folded outward were affixed to the sides so that each side formed an upsilon (ϒ) as seen in edge view. This addition to the original design successfully prevented salamanders from entering the enclosures.

Death Feigning by the Western Coachwhip Snake

Escape behavior of the western coachwhip (Masticophis flagellum testaceus) is often characterized by speedy retreat from the immediate vicinity or to the nearest cover (e.g., hole, vegetation, or boulders). Therefore recognition of death feigning was surprising and out of character with normally observed behavior and temperament. Death feigning by Masticophis flagellum was observed in six of 41 (15%) from McLennon County, Texas and reported from southern Oklahoma and eastern Texas by Gehlbach (1970). The behavior has not been observed in western coachwhips from Trans-Pecos Texas or New Mexico. Near Alpine, Texas, during the summers of 1968 and 1969, death feigning was exhibited by two of 11 (18%) non-juvenile western coachwhips examined. None of 13 coachwhips less than 350 mm snout-vent (s-v) death-feigned.

On 25 August 1968 a male (1157 mm s-v) was observed backing outstretched on the ground. Its appearance was unusual due to a highly exaggerated undulatory aspect to its configuration. Upon approach it struck and attempted to escape. I grasped the snake at midbody, and after some writhing it exuded copious amounts of saliva and/or water. Next, the posterior portion of body went limp and about 200 mm of the head and neck stiffened. The head was cocked in a ventrad position due to a high arch in the cervical area. The quadrate bones and mandibles were spread laterally, and when placed on the ground the rostral was pushed into the soil. This position was held for several minutes during which the snake was prodded and moved numerous times. The only response was that the head was laid down sideways, but still in the cocked and spread position. Feigning was continued as the specimen was placed in the collecting sack.

On 28 July 1969 a male (1150 mm s-v) that had been held in a bag for several hours death-feigned (Fig. 1). When taken out it thrashed wildly and performed similarly to the first snake. The major difference was that the arch in the cervical area was not as pronounced as with the earlier specimen.

In contrast to other observations of Masticophis flagellum (Gehlbach, 1970) and of Natrix natrix (Heusser and Schlumpf, 1962), the occurrence of death feigning in both of these specimens was associated with low ambient temperatures. The first snake was captured after a thunder shower (air 23° C), and the second individual had been in an air conditioned room prior to handling.

Gratitude is extended to Dr. James L. Vial and Harry W. Greene for critically reviewing the manuscript.

NOTES ON THE EGG LAYING HABITS OF *DEIROCHELYS RETICULARIA*

Deirochelys reticularia. On 11 May 1973 ca. 16 km E College Station, Brazos County, Texas, a chicken turtle (*Deirochelys reticularia*) was encountered as it completed nest building procedures. The nest was "goblet"-shaped, 16.5 cm deep and 30m from the edge of the flooded Navasota River. The nest was constructed in sandy soil on a slope, of about 15°, in low weeds and grasses. No trees or brush were within 50m of the nest site, which was noticeably wetter than the surrounding ground.

According to Gibbons (Copeia, 1969: 669-676), clutch size in *D. reticularia* is 5-7 eggs with reproductive senility becoming evident in turtles over 180 mm in length. In the present instance the clutch consisted of 8 eggs laid during a 20 min. period by a female 209.5 mm in length. Eggs were laid at approximately two min. intervals. The range of diameters was from 1.7-2.3 cm and the lengths ranged from 2.8-3.2 cm. The eggs were oblong, leathery, and almost pink when laid. They became white and firm after exposure to the air.

After the eighth egg was laid, ca. 5 min. passed before the turtle began to fill in the nest with dirt and debris. She remained in the egg-laying position, using semicircular sweeping movements of her hind legs to fil the nest. This required just over 15 min.

The nest was marked and checked at least once every two weeks. After eight weeks the nest was excavated. The shrunken, dried eggs contained yellow dried yolk, but no embryos.

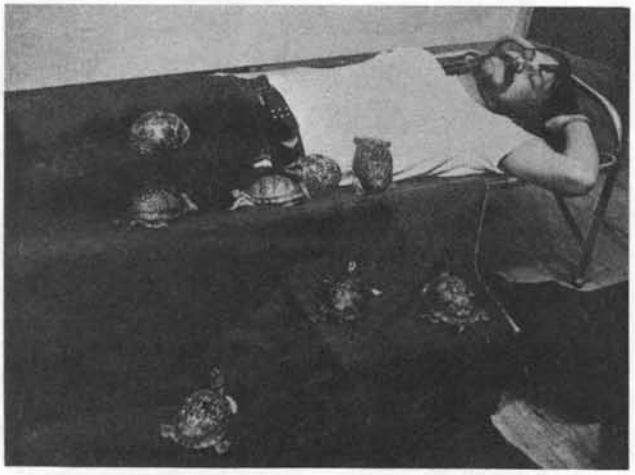
Letter to the Editor

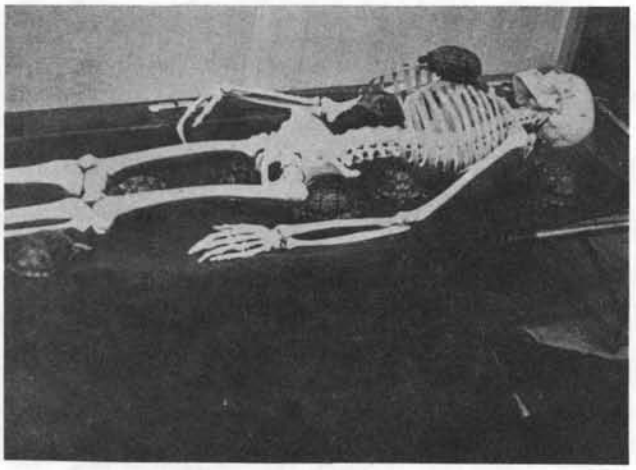
Dear Sir:

A very strong "second" to the comments of F. Harvey Pough in the December 1974 issue of Herpetological Review. Herpetologists have long had a reputation of destroying prime habitats in order to collect rare species from them. Thus making such species even more rare. A change in attitude is long overdue.

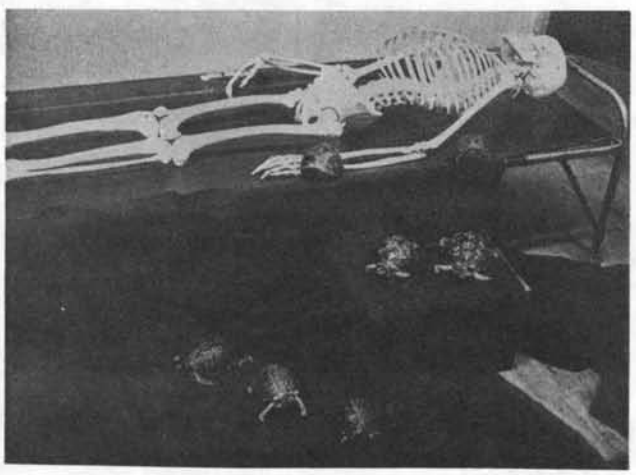
As we succeed in obtaining legislative protection for amphibians and reptiles our efforts at preserving these species comes back to affect our research. We too must abide by legislation designed to protect endangered species. Without a doubt this forces us to change the way in which we go about our business. More forethought, better planning, and greater concern for the welfare of experimental animals is required before we begin a research project. Our experimental design, facilities for housing and feeding animals and plans for disposition of animals after experiments are complete, has to be extensively documented in applications to state and federal agencies before permits are issued and research can begin. Long delays can be expected.



My experience in obtaining a federal endangered species permit to conduct thermoregulatory research on alligators may serve as an example. After an initial inquiry for information to the Interior Department I received copies of application forms and portions of the federal register containing regulations on endangered species. The completed application contained information on the following: all locations from which animals were to be collected, a brief description of the research to be conducted, and evidence of prior state approval of research activities. The last item was a problem since the state of New York would not grant a permit until I obtained a federal permit. Additional information was attached to the application as per regulations in sections CFR 13.12 and CFR 17.23 of the federal register. This included 1. Common and scientific names of species, number, age and sex of animals to be studied, 2. Details of project design, planned disposition of alligators after use and evidence of scientific expertise (curriculum vita, reprints, copy of grant proposal and copy of grant award letter), 3. Description and address of institution where laboratory studies were to be conducted, diagram of holding facilities, provisions for feeding alligators, availability of veterinary services, description of field sites and methods, 4. Reasons for using wild alligators instead of zoo animals, and 5. Plans for transport of alligators (method of shipment, type and size of containers, and supervision by project personnel).



The application was sent to the Director of the U.S. Fish and Wildlife Service on 2 December 1974. After preliminary review by the Office of Endangered Species it was published in the Federal Register. Thirty days were allowed for comment. Sometime later the application was reviewed again by the Office of Endangered Species and personnel of the Division of Law Enforcement. Finally on 24 March 1975 a permit was issued - almost four months after application was made. This type of time delay can be quite important to those persons with a one or two year grant or to those interested in gathering seasonal data. In the meantime the New York Department of Environmental Conservation issued a permit to study alligators conditional on the receipt of a federal permit.



For those who wish to study endangered species I offer the following advice: 1. Plan your research carefully, 2. Document your application thoroughly, 3. Start early - four months is a minimum time for processing of an application and 4. Don't be surprised if you lose a field season to the bureaucracy. I suppose if that is what it takes to save the alligator then it is worth it.

Sincerely,

James R. Spotila
Assistant Professor

ABSTRACTS FROM THE 1975 SSAR-HL MEETINGS
AT CALIFORNIA STATE UNIVERSITY, FULLERTON, CALIFORNIA, 10-14 AUGUST 1975

AYALA, STEPHEN C. (Universidad del Valle, A. A. 5390, Cali, Colombia). Malaria in Reptile Populations.

By human morbidity criteria, malaria is a widespread, debilitating disease of grassland and forest lizards, yet its impact remains unevaluated. With a single toe-clip blood film from each animal, it could be included in any community structure study. Prevalence frequently surpasses 30% and grave anemia may occur during the initial weeks or in later relapses (often coinciding with host reproductive periods). Pathogenicity may be slight (Plasmodium rhadinurum), moderate (P. floridense) or severe (P. mexicanum). Severely affected lizards are retiring and lethargic and many probably die unannounced in their retreats, or soon after capture. Chronic infections predominate in older animals.

BICKHAM, JOHN W. (Department of Biological Sciences, Texas Tech University). Chromosome Homology and Phylogenetic Relationships of Emydid Turtles.

Cytogenetic procedures were used to study 10 species of emydids, 2 testudinids, and 1 chelydrid. The procedures used included standard karyotypes, meiotic analysis, G-banding, C-banding, and Q-banding. The emydid subfamily Batagurinae is the primitive stock for the entire group. The batagurine genera Sacalia and Mauremys possess a karyotype which is considered primitive based on its widespread occurrence, the presence of a heterochromatic knob in pachytene, and the presence of a small, metacentric macrochromosome which is largely repetitive DNA. This heterochromatic chromosome is not present in emydids and chelydrids with derived karyotypes but is present in some testudinids.

BRANDON, RONALD A. (Department of Zoology, Southern Illinois University at Carbondale, Carbondale, Illinois 62901). Spontaneous and Induced Metamorphosis of Ambystoma dumerilii Under Laboratory Conditions.

Although Ambystoma dumerilii is not known to transform in nature, many wild-caught adults maintained in a laboratory colony, and first generation laboratory-bred animals, underwent spontaneous metamorphic changes. Metamorphosis was invariably fatal. No animal survived more than 5 months after metamorphosis began; nearly half died within a month. Four and six-month-old laboratory-bred larvae and three wild-caught animals all transformed when treated with L-thyroxine. None lived more than 48 days after metamorphosis began.

BROWN, WESLEY M. (Biology Division, Calif. Inst. of Technology, Pasadena, California 91125) and JOHN W. WRIGHT (Section of Herpetology, Natural History Museum, Los Angeles, California 90007). Mitochondrial DNA and the Origin of Parthenogenesis in Whiptail Lizards (Cnemidophorus).

Bacterial restriction endonucleases that cleave double stranded DNA at specific base sequences allow for the determination of both the frequency and the relative positions of these sequences in a mitochondrial DNA (mt DNA) molecule. We have used the restriction enzymes Eco RI, from Escherichia coli, and Hind III, from Haemophilus influenzae, to cleave the mt DNAs of several species of Cnemidophorus. With the use of agarose gel electrophoresis and electron microscopy, the resulting DNA fragments can be identified, measured and compared interspecifically. In this manner, it is possible to identify the maternal species involved in the initial

hybridization resulting in parthenogenesis, since mt DNA is both extranuclear and maternally inherited.

CONGDON, J. D., L. J. VITT, and N. DICKSON (Dept. of Zoology, Arizona State University, Tempe, Arizona 85281). Evolutionary Strategies in Lizard Tail Autotomy.

Tail break strategies are evaluated in several species of lizards variously adapted for tail autotomy. Data include observations on use of tail for predator escape and tail break frequencies in natural populations. Comparative data on regeneration rates and energy allocation to tail regeneration are presented and discussed in an evolutionary context. Additional information on lipid and water content of original and regenerated tails are presented.

GILLINGHAM, JAMES C., CHARLES C. CARPENTER (University of Oklahoma), BRUCE J. BRECKE, and JAMES B. MURPHY (Dallas Zoo). Courtship and Copulatory Behavior of the Mexican Milk Snake, Lampropeltis triangulum sinaloae.

Three complete courtship and copulatory sequences were observed in a pair of Mexican milk snakes, Lampropeltis triangulum sinaloae between July 1974 and March 1975. The third copulatory sequence was recorded on movie film and videotape for detailed analysis. These snakes show the following three major divisions of courtship and copulatory behavior: tactile-chase, tactile-alignment and intromission and coitus. Although these phases follow a general colubrid pattern, careful analysis has shown specific differences.

NAEGLE, SHIRL R. and W. GLEN BRADLEY (University of Nevada, Las Vegas, 4505 Maryland Parkway, Las Vegas, Nevada 89154). Influence of Temperature and Body Weight on Oxygen Consumption in the Desert Tortoise Gopherus agassizi.

Oxygen consumption, VO_2, was measured in 61 desert tortoises, Gopherus agassizi, ranging in size from 16.4g to 5562.4g. Measurements were taken over a temperature range of 8C to 42C. The Q_{10} for oxygen consumption between 10 to 20C, 20 to 30C and 30 to 40C were 3.2, 2.3 and 1.8 respectively. Tortoises less than 500g had significantly higher ($P < 0.05$) VO_2 rates than tortoises greater than 500g. VO_2 was found to be both temperature and size dependent and predictive equations were derived. VO_2 at 30C was less than Bartholomew and Tucker's (1964) predictive equation for lizards when total body weight was used but greater when body weight minus shell weight was calculated.

PATTERSON, ROBERT (696 Milford Road, Orange, California 92667). Distribution Determination of Gopherus agassizi.

A study of the distribution of the desert tortoise, Gopherus agassizi, was undertaken as a first step in its future protection and management. The distribution study involved the use of museum specimen records, literature records, surveys of personal sightings by professional herpetologists, Federal and State Monument and Park Rangers, and observations of high school biology teachers, their students and other amateurs. Based on this study, the data from amateurs can add substantive information to rare and endangered species studies besides being a new and positive method for involving amateurs in rare and endangered species work.

PETERSON, ELLENGENE (Dept. of Psychology, University of California, Riverside), G. W. NORTON, and ANN RICHARDSON (Dept. of Psychology, California State University, Los Angeles. Spatial Reversal Learning in Anolis carolinensis.

The use of reversal learning as a paradigm in comparative behavioral studies is well established. Such as experimental model is relevant to questions of learning, discriminative capacities, and to studies of the neural substrates of behavioral plasticity. In reptiles, however, turtles and caimen are the only groups well represented in reversal learning experiments. The present study reports the performance of six lizards (Anolis carolinensis) on a spatial reversal problem. The animals were trained against position preference on a modified Y-maze with return to home cage as reinforcement. Criterion for learning was 8/10 correct for two consecutive blocks of 10 trials (four days). All animals have shown progressive improvement as measured by error scores over successive reversals.

PYBURN, WILLIAM F. (Department of Biology, The University of Texas at Arlington, Arlington, Texas 76019). The Function of Eggless Capsules in Nests of the Frog Phyllomedusa hypochondrialis.

Eggless, fluid-filled capsules in the nests of Phyllomedusa hypochondrialis supply water to the developing embryos. Under dry conditions embryos develop normally with eggless capsules, but die in the absence of eggless capsules if not kept moist. The eggless capsules, produced by the oviducts of the female at the time of oviposition make the embryos independent of environmental water during prehatch development. This evidence indicates that, in the evolution of the amniote egg, the shell could have preceded the foetal membranes, at least in so far as the embryos' dependence upon environmental water is concerned.

RICHARDSON, ANN M. and MARILYN BROWN (California State University, Los Angeles, 5151 State University Drive, Los Angeles, California 90032). Operant Thermoregulatory Behavior in the Desert Iguana, Dipsosaurus dorsalis.

Thermoregulatory operant behavior of lizards has been limited to the use of aversive stimuli. The present study demonstrates: (1) acquisition of a lever pressing response by desert iguanas for positive (heat and light) reinforcement, and (2) predicted

relationships of this response to the lizards' control of their environmental temperature. The data indicate that the desert iguanas readily acquired a lever pressing response for positive reinforcement establishing a substrate thermal activity range of 31.7^{o}-42.2^{o} under a continuous reinforcement 10 second reinforcement schedule. Operant procedures, without the use of severe stress variables would seem to be, for these animals, the research method of choice for behavioral thermoregulation, sensory capability, and comparative learning studies.

ROSSMAN, DOUGLAS A. (Louisiana State University Museum of Zoology, Baton Rouge, Louisiana) and ALBERT SCHWARTZ (Miami-Dade Community College, Miami, Florida). Interspecific and Intergeneric Relationships of the Hispaniolan Colubrid Snake Genus Ialtris.

On the basis of color pattern and head shape Ialtris parishi and a presently undescribed species clearly are very closely related and differ markedly from I. dorsalis in these characters. Nevertheless, the nature of their dentition and hemipenes links these species and sets them apart from members of all other Antillean genera. Maglio's conclusion that Ialtris shows its greatest similarity to Alsophis, particularly in skull characters, is examined and challenged. The relationships of Ialtris to other Antillian "xenodontine" colubrid snake genera remain obscure.

TALBOT, JIM (Department of Biological Sciences, University of Southern California, Los Angeles, California 90007). Preliminary Egg Mortality Studies on Two Species of Tropical Anoline Lizards (Sauria: Iguanidae).

Mortality studies in undisturbed primary forest and cacao groves were conducted on eggs extracted from gravid females of two anoline lizard species at one tropical rainforest locality in Costa Rica. Overall mortality, expressed as the percentage of eggs dying, killed, or disappearing from the egg oviposition site over a 40 day period approached 50%. Egg mortality in undisturbed primary forest was higher than in the cacao grove. These results suggest that egg mortality may be an important factor regulating lizard abundance at any one locality. Differences between habitats may reflect physical microhabitat differences (in depth of leaf litter or in dessication rates) as well as the intensity of predation on eggs laid in the leaf litter.

VIAL, JAMES L. (Department of Biology, University of Missouri, Kansas City, Missouri 64110). Cavernicolous Eggs and Larvae of an Enigmatic Plethodontid Salamander.

A highly unusual salamander egg clutch taken deep within the aphotic region of a Missouri cave is described. Comparisons are made with eggs of other salamanders known to frequent caves. The hatchling larvae are also contrasted with literature descriptions and museum specimens. Unique differences are found in the manner of egg deposition, hatchling size and certain body proportions as well as pigmentation and behavior. Although the eggs and larval stages of several cavernicolous species are unknown, of the species for which larval descriptions are available the resemblance is closest to Eurycea lucifuga.

- - - - - - - - - - - - - - - -

VITT, L.J. and J.D. CONGDON (Dept. of Zoology, Arizona State University, Tempe, Arizona 85281). Reproductive Effort and Body Shape in Lizards: Resolution of a Paradox.

Data on reproductive effort (clutch calories/total calories) in a variety of lizard species are presented. These data suggest that body shape in lizards, selected for in view of predator escape and foraging strategies, are better predictors of instantaneous reproductive efforts than resource availability or the species' position on an r - K continuum.

- - - - - - - - - - - - - - - -

VITT, L.J., R.C. VAN LOBEN SELS, and R.D. OHMART (Dept. of Zoology, Arizona State University, Tempe, Arizona 85281). Aspects of the Thermal Ecology of Three Sympatric Arboreal Desert Lizards.

Species differences in body temperatures in addition to seasonal differences in body temperatures are discussed in three sympatric arobreal lizards, Urosaurus ornatus, U. graciosus, and Sceloporus magister. These data are evaluated in view of differences in microhabitats utilized by the various species, and differences in the thermal regimes of portions of the trees inhabited by these species. Additional data on mid-winter body temperatures are presented.

WEBB, ROBERT G. (Department of Biological Sciences, University of Texas at El Paso, El Paso, Texas 79968). A Review of the Mexican Wandering Garter Snake, Thamnophis elegans errans Smith.

Thamnophis elegans errans is confined to the pine-oak, forested highlands of the Sierra Madre Occidental and is known from the Mexican states of Chihuahua, Durango, and Zacatecas. Thamnophis e. errans invariably has 19-19-17 dorsal scale rows, 7 supralabials, and an immaculate belly; specimens from northwestern Chihuahua indicate intergradation in these characters with Thamnophis elegans vagrans. Two unique features of T. e. errans are the pale orange belly in specimens exceeding 350 mm body length, and the entirely black tongue.

WEINTRAUB, JOEL D. (Dept. of Biological Science, California State University-Fullerton, Fullerton, California 92634). Activity Patterns of Young Toads (Scaphiopus hammondi).

Activity pattern of tadpoles and recently emerged toads of the spadefoot toad, Scaphiopus hammondi were investigated in the field and in the laboratory. Tadpoles inhabit temporary pools and do not possess well defined activity patterns but are continuously active. Young roads leave the pond and find day-time refuges under plants, cow dung, and in cracks in the mud around pools. Young toads show an early evening activity peak and many a second peak just after sunrise which is under circadian control. This rhythm is established upon metamorphosis. At night young toads forage around the pools.

THE LAKE ERIE WATER SNAKE "PHENOTYPE" IN CENTRAL MISSOURI

The complete, or nearly complete, loss of a dorsal color pattern is well established in some populations of snakes (Nickerson & Mays, 1968). One subspecies of water snake, Natrix sipedon insularum, is primarily characterized by this loss (Conant & Clay, 1937).

On 2 June 1971 a Natrix sipedon, lacking a dorsal color pattern, was collected by Mark Helms just S of Eldon, Miller County, Missouri. Subsequent field work over the next three years produced some 120 Natrix sipedon from this site. Only one additional snake (taken June 1972) was found to be lacking the dorsal pattern (Figure 1).

The aberrant snakes were maintained in captivity for breeding experiments. The snake taken on 2 June 1971 died in August, 1973. The second snake remains alive in the collection of Max Allen's Zoological Gardens, Eldon, Missouri. Both snakes were of similar length in June, 1972 which suggests the possibility of them being litter mates.

The Original "Fall" Guy

THE SERPENTARIUM AT CORDOBA, ARGENTINA

by Ismael di Tada and Jaime Villa

The Serpentarium at Cordoba, Argentina, a part of the Universidad Nacional de Cordoba's Centro de Zoologia Aplicada (Center for Applied Biology), was formally inaugurated in February, 1973, as the result of the joint efforts of the University and the Ministry of Public Works.

The Centro has its own, very modern, two-story building, located on the grounds of the Cordoba Zoological Park. The upper floor is exclusively devoted to live reptile displays, for the benefit of zoogoers; the lower houses the venomous snake facility, where snakes are milked and housed. Here, visitors can observe the milking process from a very close distance, but through the safety of a glass pane (Fig. 3).

Student tours, led by upper-class biology students and serpentarium staffers, are frequent in the serpentarium. An auditorium with audiovisual facilities is also available for lectures related to snakes, their importance, habits, and role at the serpentarium.

Snakes are collected, purchased, or exchanged from sources throughout the Provincia de Cordoba. The most common or widely-distributed species are the Yarara Chica (Bothrops neuwiedi), the rattlesnake (Crotalus durissus), the coralsnake (Micrurus frontalis), the hognosed Yarara Nata (Bothrops ammodytoides) and the Yarara de la Cruz (B. alternatus). Many harmless species, ranging from large boas to minute blind snakes, are kept for research or for display purposes.

Venom-producing snakes are subjected to special treatment. Immediately after being received they are housed in individual safety cages. Detailed records of their sex, weight, venom production, moults, etc., are kept. After venom extraction the snakes are force-fed a mixture of meat and ground bone equivalent to 10-20% of the snake's weight. The process is repeated every 15 days. Some 40 to 70 snakes are milked daily.

Since very dangerous species are used all these tasks are performed by biologists and highly-trained technicians, and the observance of strict safety measures has decreased the possibility of injuries among the snake-handling personnel.

Some 60,000 mg of dried rattlesnake venom were obtained in the first 9 months of 1974, along with 15,000 and 213,000 mg of Bothrops alternatus and B. neuwiedi, respectively. About 1,000 mg are necessary, per horse, to obtain an initial antigenic response capable of neutralizing 2.5 mg of purified venom per ml of serum.

The serpentarium provides dried venom to several Argentine institutions which produce mono, bi and polyvalent antivenins. A coralsnake (elapid) antivenin is under study.

Taxonomic, ecological and biogeographical research is also produced at the serpentarium and at the Centro in general. Dr. Jorge Abalos (Fig. 1), the Centro's director, Ismael E. di Tada (Fig. 2) and Ricardo Martori (Fig. 3), are three herpetologists with varied interests in the Argentine herpetofauna, especially of the Cordoba Province forms.

GEOGRAPHICAL DISTRIBUTION

Short Reports

DISTRIBUTIONAL NOTES ON REPTILES IN ILLINOIS. With the publication of P. Smith's survey (1961), the distribution of most Illinois reptiles became well documented. We report new records (some are apparently relictual populations) of five reptile species in Illinois. Specimens deposited in Southern Illinois University-Edwardsville are designated SIUE. Other specimens were captured, identified and released.

Clonophis kirtlandi (Kirtland's water snake). Effingham, Effingham Co. (specimens observed periodically from 1959-1974); extends range 30.5 mi SE of nearest record (Holman & Arai 1962). Other apparently isolated records in Illinois and Missouri were reported by Clark (1961), Holman & Arai (1962), Jones (1967), Moll (1962), Munyer & Parmalee (1967) and Smith (1961). These populations and the Effingham population may be relictual and the species may be becoming extinct on the western edge of its range. This species is usually found in wet meadows (Conant 1958) which are now scarce in Illinois due to gradual drying up of the wet prairies and use of most of the original prairie for agricultural purposes.

Thamnophis proximus (Western ribbon snake). Litchfield, Montgomery Co. (SIUE 562) and 5 mi E junction of Hwy 66 & Honey Bend Rd., Montgomery Co. (SIUE 564); extend range 34 and 40 mi NE of nearest record (Smith 1961).

Tropidoclonian lineatum (Lined snake). 7th St. & Central Ave., Roxana, Madison Co. (SIUE 552-558, 560); Reller St., Roxana (SIUE 561); and South Roxana, Madison Co. (SIUE 559); extend range 26-27 mi S of nearest Illinois record (Smith 1961) and 17 mi NE of nearest Missouri record (Anderson 1965). These records and the other six Illinois records (Smith 1961) are on the eastern edge of the range and are the only known populations east of the Mississippi River. Smith (1961) indicated that the Illinois populations are relictual and that changes in climate and the rise of agriculture may have caused the decline of Illinois populations.

Eumeces fasciatus (Five-lined skink). 2 mi S Bartonville, Peoria Co.; extends range 22 mi NE of nearest record (Smith 1961).

Terrapene ornata (Ornata box turtle). 3.1 mi N Hudson, McLean Co., 1 mi N Chillicothe, Peoria Co., and 3.5 mi SE Brooklyn, Schuyler Co.; extend range 44.5 mi ENE, 42 mi NE, and 29.5 mi W (respectively) of nearest records (Smith 1961). The McLean Co. record is located between the relictual population along the Illinois-Indiana border and the main part of the range in west central Illinois. Since all three turtles were from old field habitats in rural areas, they probably do not represent introductions by man.

RANGE EXTENSIONS AND NEW COUNTY RECORDS OF SOME TEXAS AMPHIBIANS AND REPTILES. Present in the Texas A&I University at Kingsville collection (TAIC) are records of some Texas herps which supplement those of Raun and Gehlbach (1972, Amphibians and Reptiles in Texas, Dallas Mus. Nat. Hist.).

Range extensions are: Pseudacris streckeri.-Kenedy Co., 3 mi. S Mifflin (TAIC 1051),1.7 mi.S Sarita (TAIC 1450), 7.7 mi.S Mifflin (TAIC 2735, 2740, 2742, 2744), La Paloma Ranch, 8 mi. W Riviera (TAIC 3253, 3283), Mifflin (TAIC 3604); Kleberg Co., 4 mi. S Kingsville (TAIC 3606).These records extend the range of P. streckeri some 75 miles south of the nearest county record, Aransas County. Natrix grahami.-Dimmit Co., 3.9 mi. S Catarina (TAIC 1258); a range extension of almost 200 miles southwest of the nearest county record, Fayette County.

New county records are: Ambystoma opacum. - Panola Co., Murvual Reservoir (TAIC 3528). Notopthalmus viridescens.-Karnes Co., 11 mi. S Runge (TAIC 1538); Matagorda Co., Sloan Ranch, 10 mi. E Bay City (TAIC 2468, 2842). Hyla cinera. - Kenedy Co., 3.5 mi. S Sarita (TAIC 965). Pseudacris streckeri.- Kerr Co., Chaney Ranch, 13 mi. S Kerrville (TAIC 1050, 1863). Hemidactylus turcicus.-Kleberg Co., numerous specimens, from Texas A&I campus; Hidalgo Co., McAllen (TAIC 1363, 1382, 2749); Nueces Co., Robstown (TAIC 1441); San Patricio Co., Mathis (TAIC 1490); Maverick Co., Eagle Pass (TAIC 1882). Anolis carolinensis.-Kleberg Co., numerous specimens from the Texas A&I campus; Willacy Co., Raymondville High School(TAIC 3160).Crotaphytus collaris.-Maverick Co., 27 mi. N Eagle Pass (TAIC 136); Lubbock Co., Lubbock (TAIC 2551). Crotaphytus reticulatus. - Duval Co., 9 mi. S Freer (TAIC 3432). Phrynosoma modestum. - Winkler Co., Chonco Bluff (TAIC 1712). Sceloporus grammicus. - Refugio Co., Refugio (TAIC 1744) . Sceloporus undulatus. - Gaines Co., Seminole (TAIC 880). Ficimia olivacea.-McMullen Co., 21 mi. N Freer (TAIC 870). Natrix cyclopion. - Calhoun Co., 3.4 mi. NE Tivoli (TAIC 2854). Natrix grahami. - Refugio Co., 2 mi.NE Tivoli on Guadalupe River (TAIC 1895); Calhoun Co., 3.4 mi. NE Tivoli(TAIC 2855).Natrix rhombifera.-Maverick Co., 5 mi. S Eagle Pass (TAIC 1939), Manges Ranch, 1 mi. E Eagle Pass (TAIC 2142); Calhoun Co., Green Lake TAIC 2395). Tantilla atriceps.-Maverick Co., 6 mi. W Eagle Pass (TAIC 2149). Tropidoclonion lineatum. - Crockett Co., Ozona (TAIC 2540). Sistrurus catenatus.-Webb Co., U.S. 44, 1 mi. NE junction with U.S. 83 (TAIC 1930); Brooks Co., 2 mi. E Brooks Co. line on FM 755 (TAIC 2450).

All identifications verified by Dr. Allen H. Chaney, to whom I am indebted for access to the collection and help in writing this paper. Submitted by Glenn W. Merkord, Dept. of Biology, Texas A&I University at Kingsville, TX 78363.

NEW COUNTY RECORDS AND RANGE EXTENTIONS FOR TEXAS AMPHIBIANS AND REPTILES. The following records for Texas amphibians and reptiles supplement those of Raun and Gehlbach (1972, Amphibians and Reptiles in Texas, Dallas Mus. Nat. Hist., Bull. No. 2) and Lewis (1974, Herp. Rev. 5(1):21). Specimens listed in this report are deposited in the Northeast Louisiana University Vertebrate Museum (NLU), Monroe, La.

NEW COUNTY RECORDS. Caudata: Ambystoma tigrinum mavortium, Midland Co. (NLU 31798; Notophthalmus viridescens louisianensis, Madison Co. (NLU 35657-60). Salientia: Acris crepitans blanchardi, Motley Co. (NLU 31349-52); Bufo cognatus, Parmer Co. (NLU 18064); B. marinus, Cameron Co. (NLU 1431); B. speciosus, Hardeman Co. (NLU 28934), Maverick Co. (NLU 24809-20), McMullen Co. (NLU 36037-8); B. w. woodhousei, Lubbock Co. (NLU 31800-02); Gastrophryne carolinensis, Milam Co. (NLU 20884); G. olivaceus, Kleberg Co. (NLU 28983-6); Rana pipiens sphenocephala, Marion Co. (NLU 32255-62; Scaphiopus bombifrons, Mitchell Co. (NLU 36147-50); S. couchi, Robertson Co. (NLU 20895); S. hammondi, Parmer Co. (NLU 17689-90). Testudines: Dierochleys reticularia maria, Orange Co. (NLU 7713, 15018); Kinosternon f. flavescens, Ward Co. (NLU 36145); K. subrubrum hippocrepis, Smith Co. (NLU 36658); Malaclemys terrapin littoralis, Brazoria Co. (NLU 29556); Terrapene ornata, Madison Co. (NLU 16626), Sauria: Cnemidophorus sexlineatus, Jim Wells Co. (NLU 27377-85), Kaufman Co. (NLU 35911), Kinney Co. (NLU 28850); Crotaphytus collaris, Motley Co. (NLU 18293); Eumeces obsoletus, Garza Co. (NLU 36399); Holbrookia maculata, Coke Co. (NLU 17642), Dickens Co. (NLU 17648). Serpentes: Arizona elegans, Kent Co. (NLU 28936), Knox Co. (NLU 28958), Stonewall Co. (NLU 28906), Upton Co. (NLU 29995); Coluber constrictor, Smith Co. (NLU 36656); Crotalus atrox, Stonewall Co. (NLU 28898, 28949), Upton Co. (NLU 29985, 29996-7); Elaphe guttata emoryi, Dimmit Co. (NLU 36209), Jim Wells Co. (NLU 28974); E. obsoleta, Lampasses Co. (NLU 28717); Heterodon nasicus, Lynn Co. (NLU 17694); Lampropeltis c. calligaster, Smith Co. (NLU 36657); L. getulus splendida, Garza Co. (NLU 28897); L. triangulum, Kennedy Co. (NLU 28669); Leptotyphlops d. dulcis, Comal Co. (NLU 36687-9), Neuces Co. (NLU 761-7); Masticophis flagellum, Crosby Co. (NLU 18071), Dickens Co. (NLU 26543), Mitchell Co. (NLU 28714), Upton Co. (NLU 29984); Micrurus fulvius tenere, Uvalde Co. (NLU 28593); Natrix erythrogaster flavigaster, Milam Co. (NLU 22806); Pituophis melanoleucus, Hockley Co. (NLU 16077), Jim Hogg Co. (NLU 36438, 36947), Yoakum Co. (NLU 28942); Rhinocheilus lecontei tessellatus, Mitchell Co. (NLU 28989), Stonewall Co. (NLU 28925-7); Storeria dekayi texana, Milam Co. (NLU 20891-3, 22796-7, 28700); Tantilla nigriceps, Cooke Co. (NLU 16531-2), Jim Hogg Co. (NLU 36338), Lubbock Co. (NLU 17636), Midland Co. (NLU 17634-5); Thamnophis cyrtopsis ocellata, Crockett Co. (NLU 28716); T. m. marcianus, Garza Co. (NLU 31807-8), Lubbock Co. (NLU 16111-2), Parmer Co. (NLU 16113).

MARGINAL RECORDS. Caudata: Plethodon glutinosus albagula, Guadalupe Co. (NLU 15098-112, 17105-19). Salientia: Scaphiopus bombifrons, Terrell Co. (NLU 18091). Sauria: Phrynosoma modestum, Menard Co. (NLU 29408); Sceloporus olivaceus, Irion Co. (NLU 19733), Stonewall Co. (NLU 18076-8); Urosaurus ornatus, Winkler Co. (NLU 16093-4). Serpentes: Elaphe obsoleta, Irion Co. (NLU 29978).

RANGE EXTENSION RECORDS. Arizona elegans (Glossy snake). Henderson Co., 8 km NE Athens; 10 September 1970; T.P. Guidroz and P.S. Hambrick, NLU 28678. Extends known range 160 - 200 km to the northeast. First record east of the Trinity River. Perhaps this denotes a small disjunct population in this area of the state. Regina grahami (Graham's water snake). Bexar Co., San Antonio; no date (presumably late 1930's); NLU 24894. Fort Sam Houston; 26 May 1971; NLU 36043-4. These specimens verify the claims of earlier collectors (Baird and Girard, 1853, Smithsonian Misc. Coll., Art. 5; Strecker and Williams, 1927, Cont. Baylor Univ. Mus., 12:1-16; Brown, 1950, Baylor Univ. Stud., 257 p.) that R. grahami is present in Bexar Co. Raun and Gehlbach (op. cit.) reported these as dubious records. These records extend the range of R. grahami 160 - 200 km westward. Submitted by PATRICK S. HAMBRICK, Dept. of Zoology and Physiology, Louisiana State University, Baton Rouge, La. 70803.

HERPETOLOGICAL FOLKLORE STORIES: WHO BELIEVES THEM?

Charla Lynn Jordan and Ronald Altig

After being called from his bath by his wife screaming about a snake loose in the house, an elderly man knelt on the floor to peer under a chair. When the pet dog touched him gently, he had a heart attack, and when his wife again screamed about the snake as the rescue men carried him down the stairs, they dropped him and broke his leg. The perils of ophidiophobia are still with us!.

While talking to a person uninformed about herpetological facts, one can almost be assured of being upstaged by a sequel story or at least being asked if such-and-such is true. Conversely, rebuttals of such stories are often met with intense arguments. Such folklores have a wide geographic basis as snakes especially have entered into the lore of numerous cultures. The stories are handed down from generation to generation, and friends are seemingly more easily believed than "scientists".

Conversely, through technological and communicational advances, we may generalize that students today would be more aware and better informed than in the past. Therefore, by use of a simple survey, we attempted to determine the extent to which college students still believe herpetological folklores.

Materials and Methods

Questionnaires requesting the respondents' sex (race and religion were abandoned because of the reluctance of the respondents to give this information; state in which the person grew up and whether it was in an urban or rural environment were abandoned because of the low site tenacity of many respondents) were sent to faculty members of Adelphi University, Long Island, New York (A), University of California at Berkeley (B), University of Colorado (C), Michigan State University (D), and Mississippi State University (E). These persons were asked to have 100 members of a beginning biology course fill out the forms. Actual responses were as follows: (A) 96, 49 females, 47 males; (B) 100, 50, 50; (C) 63, 29, 34; (D) 92, 58, 34; and (E) 84, 38, 46. Because of unequal samples data are presented as percentages.

The respondents were asked to score the following subjects as "T" if they considered it true, "F" if they knew it was false or would consider it so without being told differently, "C" if they once had believed it but had changed their mind after reading a contradiction or being told by a competent person, or "O" if they had never heard of the subject.

1. Rattlesnakes will not cross a horse-hair rope.
2. Female snakes swallow their young to protect them from enemies.
3. Snakes swallow items bigger than their heads.
4. Toads give you warts.
5. Blue-tailed skinks ("scorpions") are poisonous.
6. Snakes sting or bite with their tongues.
7. Toads live indefinitely without air.
8. Coachwhip snakes whip their prey to death.
9. Milk snakes suck milk from cows.
10. Snakes hypnotize their prey with their eyes.
11. Rattlesnakes travel in pairs.
12. Snakes can crawl faster than a galloping horse.
13. Snakes cannot bite underwater.
14. Hoop snakes grab their tails in their mouths and roll downhill after you.
15. If the tail spine of a stinging snake pierces your skin or the bark of a tree, you and the tree will die.

16. A mutilated snake will not die until sundown.
17. A turtle that bites you will not turn loose until sundown or until it thunders.
18. Snakes are charmed by the sound of a flute.
19. Rattlesnakes rattle before they strike.
20. Rattlesnakes cannot strike until they coil.
21. A jointed snake or glass snake can break into several pieces but can rejoin after sundown.
22. Blood squirted from the eye of a horned toad causes blindness.
23. Snakes will attack unprovoked rather than run.
24. Toads are poisonous.
25. Hognose snakes (puffing adder, spread adder, spread-head, hissing snake, blow viper) are poisonous.

Statements 3 and 24 were included as facts, although the respondent might have to be better informed to know that toads are poisonous only via the skin than to know that snakes can swallow items larger than their heads. The latter seems to be one of the first "facts" learned about snakes. Also, Grogan (1974) has reported pathological effects from the bite of a hognose snake (Heterodon), but we will ignore that for the moment. Bias was no doubt introduced by the variability in the familiarity with common names, some of only local origin, and the class at Michigan State University, which was a second year biology course.

Results and Discussion

Table 1 presents the percentages of the responses in each of the four categories. We looked only at means and obvious trends, and purposely avoided statistical treatment. All statements had been heard of by someone (although the average number left to respond after the "0" column was subtracted was only 299 or 68.7% of the total), there were no statements that were believed by all (statements 15 and 16 were marked true by only 8), and no statement was considered false by all.

Most (88.8 - 97.8%) of the people recognized item 3 as true, although 16 people had never heard of this idea. On the other hand, 62.5 - 85.7% thought that No. 24 was false.

In general, it can be said that most students do not believe the folklores; means of the false columns ranged from 48.1 - 57.1 ($\bar{x}$ = 52.7)%, while the true column ranged from 12.6 - 18.1 ($\bar{x}$ = 15.0)%. Contrary to expectations, students from no particular geographic area believed many more of the stories than any others. However, there was a more pronounced difference, between areas, concerning the percentage of the stories that the respondents had heard. Adelphi and Berkeley students, both from metropolitan areas, had larger percentages (heard of fewer stories) (32.6 and 34.7% respectively) than the other three (C = 23.7, D = 26.9, E = 23.7%). A number of the folklores seemed to be of southern origin (at least based on southern species) and folklores seemingly are more common in rural areas, so these two concepts probably account for these differences. Also, fewer of the students from these two schools had changed their minds(2.4, 2.6%) relative to students at the other schools (4.8, 6.0, 5.9%). Note that statements 4 and 18 (toads give you warts and snakes are charmed by a flute) are the two statements with the highest "changed my mind" percentages. Typically, few of the students had changed their minds; they considered most of the stories false all along.

There were slight, but no doubt nonsignificant, differences in the responses of the two sexes. Except in Mississippi where boys believed more than girls by an average of 2% (based on means of "T" and "F" columns), boys believed less than girls (0.1 - 3.3%).

Girls had heard of fewer stories than boys by about 13 (2.3 - 23.3%), and girls, except in Mississippi (boys 2.4% more than girls), had changed their minds more often than boys (0.3 - 3.2%). These conclusions seem likely since boys probably encounter and discuss such topics more frequently.

Items 5, 19, and 20 often had higher true scores. No. 5 may have been high because of a misinterpretation of the typically southern name of "scorpion" for blue-tailed skinks (Eumeces); the other two were apparently "known facts".

So it appears that a belief in herpetological folklores has a minority foothold which is reasonably uniform across the country. If the parents and grandparents of these students and subsequent students could be surveyed, we would expect a steady increase in the "F" responses. If not, perhaps we are not educating students about lower vertebrates. But, on the other hand, what has happened to many campfire stories!

Caribbean Research News

JOHN W. BICKHAM and ROBERT BAKER (Dept. of Biological Sciences, Texas Tech University, P.O. Box 4149, Lubbock, Texas 79409) spent eight weeks in the Caribbean collecting turtles for cytogenetic study. Seven species (Chrysemys, Rhinoclemmys, Kinosternon, Geochelone) were collected from Jamaica, Hispaniola and Trinidad; work on the karyotypes and chromosome banding of the species is continuing, with the hope of incorporating some of these data into a larger study on emydid karyotypic evolution.

JEANNE MORTIMER (University of Florida) is in Nicaragua studying the feeding ecology of the green turtle in its home-pasture habitat.

SCOTT J. MANESS and ROBERT GODSHALK, zoologists employed by the Peace Corps and the Ministerio de Agricultura y Cria of Venezuela, are studying the biology and conservation of Venezuelan crocodilians. They are also studying the ecological and altitudinal distribution of the reptiles of Rancho Grande, Parque Nacional Henri Pittier, Venezuela.

****

The next ESHL Eastern Seaboard Herpetological League will be sponsored by WHS and VHS. It will be held in the auditorium of the Museum of Natural History, Smithsonian Institution, Washington, D.C. on October 18, 1975. The meeting will begin at 10:00 A.M. and will end at 6:00 p.m.

****

****

GREAT NEWS!

Your 1976 SSAR dues will remain the same! While most other societies have been forced to increase their dues, SSAR dues will remain the same through 1976.

****

A N N O U N C E M E N T

The 1974 - SSAR Student Prize for the best student paper published in the Journal of Herpetology in 1974 was awarded to Eliezer Frankenberg of Hebrew University of Jerusalem for his paper, "Vocalization of males of three geographical forms of Ptyodactylus from Israel (Reptilia: Sauria: Gekkoninae)".

CURRENT LITERATURE

NOTICE: The Current Literature project is now being handled by the Milwaukee Public Museum. All searchers: Please note the change in address.

As of July 1974, 59 searchers are scanning a total of 408 journals.

Searchers: As the titles will be published 4 times per year, try to send your titles in at least 4 times a year to have an approximately equal listing each issue in HR.

Due to lack of space in this issue, an updated list of journals is not included. Such an updated list is scheduled for next issue, budget permitting.

Any questions, comments, etc. should be sent to:

Max A. Nickerson
Current Literature
Vertebrate Division

RECENT DEATHS

On 2 August 1975 Dr. Roberto Donoso-Barros died in a tragic automobile accident in Concepcion, Chile. He was 53 years old. Dr. Donoso-Barros is best known among herpetologists for his "Reptiles de Chile" published in 1966 and for his coauthorship (with the late James A. Peters) of the volume on lizards in the "Catalogue of Neotropical Squamata" (1970). Dr. Donoso-Barros is survived by his wife and six children.

"Every red-blooded herpetologist should wear one!"

SYMPOSIUM ON ENDANGERED AND THREATENED BIOTA ON NORTH CAROLINA

The North Carolina State Museum of Natural History is sponsoring a Symposium on Endangered and Threatened Biota of North Carolina, November 7-8, 1975, at Meredith College, Raleigh. The Symposium will be co-sponsored by the N. C. Academy of Science, the Department of Natural and Economic Resources, and the Wildlife Resources Commission.

Dr. Richard C. Bruce, Highlands Biological Station, will be responsible for amphibians and reptiles.

Fur further information contact Dr. John E. Cooper, N. C. State Museum, Box 27647, Raleigh , NC 27611.

****

CATALOGUE OF AMERICAN AMPHIBIANS AND REPTILES

(Now published by the SSAR)

****

A loose-leaf series of 2- to 4- page species accounts of the amphibians and reptiles of the Americas, with special emphasis on those in the United States and Canada. Accounts 1-150 were published from 1963 to 1972.

Binder, Taxonomic Tabs, and Accounts 1-150.

Individuals.....$ 25.00
INSTITUTIONS.....$ 35.00

Subscription to accounts 151-175 (published through no. 163 to date)

Individuals.....$ 6.00
INSTITUTIONS.....$ 12.00

Write: HENRI C. SEIBERT, SSAR
Department of Zoology
Ohio University
Athens, OH 45701 USA

****

In conjunction with the Virginia Herp. Soc. I am compiling a bibliographical account of the herpetofauna of that state. Tentative plans are to include this in a publication on the known distribution of the herps of Va. Reprints and publications with reference to any Va. herp are needed. Please send these to: JOSEPH C. MITCHELL, Dept. of Zoology, Arizona State University, Tempe, AZ 85281.

****

FOR SALE OR EXCHANGE: Duplicate herpetological publications from my library. Approx. 700 papers and books. Many out of print. For list write:

RECOMMENDATIONS FOR THE MANAGEMENT OF HERPETOLOGICAL MUSEUM COLLECTIONS

Prepared by the
Committee on Resources in Herpetology[1]

One of the objectives of the Committee on Resources in Herpetology was to prepare a report which would include recommendations for effective use of the resource in the fulfillment of scientific and societal goals. The Committee's Final Report dealing with a variety of aspects of the resource in systematic herpetology was submitted in January 1975 to the National Science Foundation (which funded the Committee's activities) and to other sponsoring organizations[1]. The body of this report is to be published in Copeia and a summary of preserved collections of amphibians and reptiles in the United States will appear in the Circular Series of the SSAR. The present article, extracted from the Final Report, presents in outline form the Committee's basic recommendations for the management of herpetological museum collections and includes guidelines for rendering service to the scientific community and the general public.

Recommendations such as these are being prepared or have been prepared by a number of similar committees affiliated with the Association of Systematic Collections and acting under the auspices of discipline-oriented professional systematic societies.

A number of the recommendations that follow (marked with an asterisk) are essential for the operation of a well-managed museum collection of herpetological materials. Guidelines for management of living collections are similar to those listed here. These have recently been published for collections of amphibians[2], but no equivalent guidelines are yet available for collections of living reptiles.

I. Collection Management

*A. All specimens must be acquired in accordance with foreign and domestic laws, and should be deposited in institutional collections.

*B. An institution housing a herpetological collection must demonstrate a long-term commitment to the maintenance and service goals outlined herein.

1. Evidence of such a commitment is demonstrated by the institution providing at least one permanent professional curatorial position for overseeing the maintenance of the collection and providing for sufficient space, supplies, and equipment to attain the minimum goals of good collection management.

2. Institutions unwilling to assure a long-term commitment should actively seek a transfer of their collections to an institution willing to guarantee permanent collection care; the herpetological community should promote such transfers.

[1] A joint committee of the American Society of Ichthyologists and Herpetologists, the Herpetologists' League, the Society for the Study of Amphibians and Reptiles, and the Association of Systematic Collections. Members: David B. Wake (Chairman), Richard G. Zweifel (Vice Chairman), Herbert C. Dessauer, George W. Nace, Eric R. Pianka, George B. Rabb, Rodolfo Ruibal, John W. Wright and George R. Zug.

[2] Guidelines for the breeding, care, and management of laboratory animals: Amphibians. National Academy of Sciences, 1974. 153 p.

C. Standards for the preservation and maintenance of specimens.

*1. Each specimen (with some exceptions, e.g. series of larvae) should be individually tagged with a label giving at least a catalog number and identifier of the institution.

*2. The standard museum specimen should be fixed in a 10% formalin solution buffered to near neutrality following established procedures.

*3. Storage of specimens.

a. Standard museum specimens should be stored in 65-75% ethyl alcohol solutions, preferably in a cool, dark area with a stable temperature. Under special circumstances, a 60-70% isopropyl alcohol solution may be used as a substitute. Amphibian larvae should be stored in a buffered 10% formalin solution.

b. Histological preparations, tissue samples, sound tapes and other kinds of herpetological specimens should be preserved by tested methods which assure both long preservation and maximal usefulness.

*4. The curators must follow a regular program of specimen care (check alcohol levels, catalogue incoming material, etc.).

D. Specimen-related data.

*1. Minimum data.

a. Serial number and number of specimens included therein with their original numbers and current museum identifiers.

b. Scientific name.

c. Collection site: country, political subdivision, location to nearest town (as cited in original data books), and, if possible, elevation, latitude, longitude.

d. Collector and collecting date (preservation date, if different).

e. Reference to field notes or other data.

2. Elaboration of basic data, such as:

a. Nature and condition of specimen.

b. Its significance as voucher specimen and appropriate reference.

c. Sex, reproductive condition, ecological, and physiological parameters.

d. Type of associated material e.g., tissue type or karyotypic slides.

3. Maintenance of specimen files.

*a. Serial files (entries should be made in a machine readable form).

*b. Taxonomic file -- a hierarchical arrangement down to and including species. Computer print-out is desirable.

*c. Geographic files. Computer print-out is desirable.

d. Special files are useful for retrieval of data from accessory collections. In most instances these should be arranged taxonomically, at least.

II. Services Provided by Collections.

*A. High accessibility to qualified investigators.

1. Lending policy.

a. All reasonable requests for specimens and specimen related data should be honored.

b. Type specimens should be available for loan. Special conditions of transport, care, and duration of loan may be specified by the lending institution.

2. Research space and standard equipment should be provided for visiting investigators.

3. Library facilities available to curatorial staff and visitors should include the major journals, books, and reprints associated with the major area of coverage of the collection.

*B. Collection to serve as an active depository for the following items.

1. Specimens collected on federally supported projects.

2. Specimens documenting research and distributional data.

3. Collections receiving inadequate care, whether institutional or private (professionally trained curators have the responsibility of evaluating incoming collection for total or partial inclusion in their collection).

*C. Provide information service to investigators and the public.

1. Aid investigators in utilizing the collection, so that maximum data can be retrieved.

2. Provide the scientific and lay public with information on the identity and biology of amphibians and reptiles (this service must not be interpreted as requiring institutions or individual curators to supply, uncompensated, large blocks of data, such as those required for environmental impact statements).

3. To provide these services effectively and to care adequately for the collection, the curator should have direct control of a budget.

D. Communication system for rapidly relaying the latest information on curatorial methods, supplies, equipment, and services to interested parties.

The next meeting of the Eastern Seaboard Herpetological League will be in Washington, D.C. on the last Saturday of October, 1975 jointly sponsored by Washington Herpetological Society and Virignia Herpetological Society.

Stanley Dyrkacz in cooperation with Dr. Max Hensley (Michigan State University) is involved in an effort to record all recent occurrences of albinism in reptiles and amphibians. This new list will not repeat specimens previously recorded by Hensley (1959. Publ. Mus. Mich. State Univ. 1:135-159). Dyrkacz will appreciate hearing from anyone having specimens and/or photographs. Reprints on albinism and other information can be sent directly to: S. Dyrkacz, 3012 Walnut Drive, Wonder Lake, IL 60097.

THE STATUS OF THE NEAR-EXTINCT HOUSTON TOAD (BUFO HOUSTONENSIS) WITH RECOMMENDATIONS FOR ITS CONSERVATION

In the late 1940's and early 1950's the amateur herpetologist John C. Wottring and field companions collected a number of small, unique toads in the vicinity of Houston, Texas. Wottring was not sure of their specific identification and in his travels around the country he showed specimens to many herpetologists and played tapes of their mating calls which he had recorded. These herpetologists included Ottys Sanders of Dallas, who described the Houston toads as a new species (Bufo houstonensis) in 1953.

In ensuing years it became apparent that there were nine isolated populations of B. houstonensis in central and southeastern Texas (Brown, 1971, 1973). All population sizes appear quite low but a population in Bastrop County is somewhat larger and more extensively distributed (Brown, 1971). The species seems restricted to sandy areas often characterized by the presence of Loblolly Pine, Pinus taeda (Brown, 1971; Kennedy, 1962). W. F. Blair (1965) suggested that B. houstonensis originated as a relict of Bufo americanus after the latter withdrew northward at the close of the Wisconsin glaciation. Most workers consider B. houstonensis and B. americanus to be closely related and the two species were thought by A. P. Blair (1957) to be conspecific. Brown (1973), however, has shown that there are considerable differences in the mating calls (an important isolating mechanism in anurans) of the two species.

B. houstonensis was found to hybridize with Bufo valliceps and Bufo woodhousei in the Bastrop Co. population (Brown, 1971). B. houstonensis X B. valliceps natural hybrids are intermediate in morphology between the parental species but have an abnormal mating call that is usually not intermediate between the mating calls of the parental species. Since B. houstonensis and B. woodhousei are similar in morphology, it is difficult to distinguish their hybrids from either parental species. These hybrids, however, have mating and release calls that are intermediate between those of the parental species (Brown, 1971; Brown and Littlejohn, 1972). Natural hybrids were found at a total of four localities from 1-7 map miles apart in the Bastrop population. Habitat alteration by man appears to be the most probable cause of the natural hybridization (Brown, 1971).

From 1965-7 few or no B. houstonensis were found at most localities (Brown, 1971). The species is probably extinct or effectively extinct (because of extremely small numbers) at most localities with the exception of the Bastrop population. Bastrop choruses were still found in 1967, but there were probably no more than 300 B. houstonensis (possibly less than 100) in Bastrop Co. It is difficult to estimate population size because of the dispersed nature of the population and secretive habits of the toads. The Bastrop population is still extant and R. Martin (per. com.) found a chorus there in the spring of 1974. R. Thomas (per. comm.) also found a male at the Caldwell locality in the spring of 1974.

There are several possible causes of the trend toward extinction (Brown, 1971). Habitat destruction by man, particularly the elimination of sandy habitats, appears an important role. Because of small population sizes, B. houstonensis was entered as an Endangered Species in "Rare and Endangered Fish and Wildlife of the United States" (Peters, 1968). It is also listed in "Red Data Book Vol. 3 - Amphibia and Reptilia" (Honegger, 1970), "Threatened Wildlife of the U.S." (Office of Endangered Species and Int. Act., 1973), and the "U.S. List of Endangered Fauna" (Ibid., 1974). Additionally, the plight of the Houston Toad was publicized in Time magazine (Anonymous, 1969) and Newsweek magazine (Gwynne, 1975).

The Endangered Species Act of 1973 provides that "The Secretary of the Interior shall establish and implement a program to conserve (A) fish or wildlife which are listed as endangered species..." [Sec. 5. (a)]. In Jan. 1975 I wrote R. Skoog (Chief, Office of Endangered Species and Int. Act.) and asked what conservation plan they had in mind for B. houstonensis. Skoog indicated no plan existed but they hope to formulate one. Thus, in spite of publicity about the near-extinct status of B. houstonensis and the means for implementing a conservation program, no direct action has been taken toward the preservation of this species.

Since a mere toad lacks those esthetic qualities that make many of the endangered species of birds and mammals more appealing, it is unrealistic to assume that there will be extensive public support for establishing refuges for B. houstonensis. This is especially true since several of the populations are in or near Houston. Because of very small populations and proximity to metropolitan areas, I do not think it is feasible to attempt conservation in the vicinity of Houston. The Bastrop population would be the best place to direct conservation measures because: (1) the species is most numerous there; (2) the State of Texas owns land in the area (Bastrop and Buescher State Parks); (3) the habitat is far less disturbed than at other localities; (4) a large area of undisturbed land in Bastrop Co. is potentially available for a refuge; and (5) there are no metropolitan areas close to the population. However, this area is still subject to environmentally destructive activities. In the mid-1960's habitat alteration was mainly due to housing developments, road building and repair, agriculture, and activities carried out in conjunction with the state parks (clearing of land for camping, picnicing, golf courses, parking lots, construction of buildings, etc.). Presently there is increased danger from housing developments (W. James, per. com.) and the potentiality of lumbering (M. Peyton, per. com.).

I propose that a five-step plan be initiated to conserve B. houstonensis in Bastrop Co. The first step would be a publicity campaign to inform Texas residents about the near-extinct status of B. houstonensis. Erection of billboards at the entrances to the two state parks, distribution of pamphlets in the state parks and surrounding area, and newspaper and television publicity might prove effective in alerting the public and in curtailing further environmental destruction. Publicity could emphasize the appealing mating call of the Houston Toad (a long, high pitched trill - see Brown, 1971, 1973 for details). It resembles the tinkling of a small bell and is esthetically the most pleasing vocalization of all the toad species I have heard. The second step would involve use of zoning law to place all sandy habitats and land covered by pines in a Conservation District. Construction of buildings and roads, expansion of the state parks, clearing of land, and all other environmentally destructive activities could be prohibited in this zone. Violators could be subject to the penalties of the Endangered Species Act of 1973. The Secretary of the Interior could use the broad powers given to him by this Act to implement this zoning law. Alternately, the County Board of Bastrop Co. or the State of Texas could develop zoning laws. The Texas Hwy. Dept. appears ready to cooperate as they recently issued an environmental brief on B. houstonensis (McClure, 1974). This brief is used by district engineers in preparation of Environmental Impact Statements (R. Lewis, Tex. Hwy. Dept., per. com.). Because of the pines and scenic views in Bastrop Co., many Texas residents would probably go along with this type of zoning regulation. This approach has proven successful in preserving the wilderness area along the Mackinaw River in Woodford Co., Ill. (Zoning Commission of Woodford Co., 1962 et seq.). The third step would be acquisition of all sandy areas and land covered by pines for a refuge. Eminent domain could be used or land could be purchased as it becomes available. The

Endangered Species Act of 1973 encourages cooperation between the states and federal government for establishment of refuges and provides that money be appropriated for this purpose. The fourth step would be restoration of all environmentally disturbed land to an undisturbed condition. The fifth step would involve increasing the numbers of B. houstonensis through artificial fertilization of eggs in the laboratory (see Peters, 1968). Tadpoles could be raised through metamorphosis and young toads could be released at the Bastrop refuge. Laboratory propagation would reduce losses due to death in the susceptible pre-metamorphic stages. Implementation of all five steps would probably prevent extinction of B. houstonensis. If only the first two steps were carried out (involving expenditures of little money), the environmental situation would be held at status quo and the future of the Houston Toad would appear brighter.

Certainly some attempts are called for to save the Houston Toad. All species are worth conserving regardless of whether or not some species might be less pleasing to the eyes of some humans. It is doubtful that anything less than determined action can save the interesting Houston Toad from extinction. I am afraid that inactivity and quiet sympathy for this endangered toad's plight will only result in its extinction becoming a reality with the passage of time.

Acknowledgements: I thank W. James, R. Lewis, R. Martin, M. Peyton, R. Skoog and R. Thomas for providing information that aided the preparation of this ms., and J. Brown, R.S. Funk, D. Moll and J. Tucker for critically reading the ms. This paper was modified and expanded from a report ("Status of the Houston Toad, Bufo houstonensis Sanders" by L.E. Brown) prepared for The Texas Organization for Endangered Species in Jan. 1974.

SNAKES. Ruth B. Gross. 1975. Four Winds Press, 58 p. Snakes, snakes, and more snakes. This book tells the elementary and junior-high school set all they want to know about snakes and then some more. The writing style is aimed at the young reader and maintains a pleasant and interesting flow of facts and ideas. The test is supplemented by numerous, good to excellent b/w and color photographs - 40 plus. Baby snakes, shedding, capturing and eating prey, enemies, locomotion, and keeping warm are the major topics of snake biology that are discussed. A section on types of snakes - nonpoisonous and poisonous, US and Canadian species and other snakes of the world - are illustrated in color, each with a short paragraph on habits and distribution. This book is highly recommended and will hopefully appear in many elementary school libraries. The book appeared in paperback and a different format in 1973 (Scholastic Book Service). Text and photographs remain the same in this new edition, but the larger page size, glossy paper, and new format add to its attractiveness.

May 1975

Two hundred and seventy-five green sea turtles were released at Cape Florida State Park by the Miami Seaquarium. The seven-month old turtles are part of a project, undertaken with the Florida Department of Natural Resources, to repopulate the Florida coast with giant green turtles. Each of the turtles was individually marked with a tag. Turtles released in the past from Cape Florida have turned up as far south as Venezuela and as far north as New York City. It is hoped that when the turtles mature they will return to Cape Florida Beach to lay their eggs.

AN OCCURRENCE OF AMPHIGONIA RETARDATA IN THE WHITE-LIPPED VIPER, TRIMERESURUS ALBOLABRIS

Amphigonia retardata has been noted in various species of reptiles. Viable sperm stored by females may last for 6 years in the snake Leptodeira annulata polysticta (Porter, 1972).

Stewart (1972) reports sperm storage in Thamnophis couchi hammondi and summarizes the references of this phenomenon pertaining primarily to Thamnophis. Nickerson (1974) lists an occurrence of amphigonia retardata in Trimeresurus popeorum. However, information regarding sperm storage in other species of Trimeresurus is apparently lacking.

In April 1971, I received a single, adult female white-lipped viper, Trimeresurus albolabris, 50cm in length, with the posterior one-third of its body swollen and appearing injured. It was maintained in complete isolation.

On 13 June 1971 she gave birth to two young, one deformed but alive (died within a week), and one normally developed but dead. Four undeveloped eggs were also present.

One 30 June 1972 she gave birth to eight living young. No undeveloped eggs were noted, however, the left eyes of four of the young were incompletely developed. Otherwise, all were healthy, struck vigorously when threatened and fed well on Blanchard's cricket frogs, Acris crepitans blanchardi.

RIDLEY'S SEA TURTLE ON THE COROMANDEL COAST OF INDIA

A survey of the status of Ridley's sea turtle (Lepidochelys olivacea) on India's Coromandel Coast was made between 10 December 1973 and 15 March 1974.

Because Lepidochelys is considered a "god" by the coastal fishermen, it has a good chance for survival. Apparently the turtles and their eggs are not harvested unless fish are scarce. Even then, they take only what they need. Unfortunately, however, non-fishermen exploit the turtles and "collect and sell them [the eggs] by the thousands".

The nests of Lepidochelys are predated upon by jackals, dogs and man, with jackals apparently taking the highest toll.

The Madras Snake Park hopes to establish a "Croc Bank" for the breeding and perpetuation of India's endangered crocodilians. Two and one-half acres of beach land have been purchased for this project and it is hoped that the site will also become a turtle research centre. Unfortunately, lack of funds has postponed the initiation of either project.

GEOGRAPHIC DISTRIBUTION

HERPETOLOGICAL REVIEW publishes brief notices of new geographical records in order to make them available to workers in published form. The STANDARD FORMAT for a record is:

SCIENTIFIC NAME (Common name). Locality (air-line distance to nearest town); date; collector. Identified or verified by. Place of deposition and catalogue number. Comments. SUBMITTED BY. address.

Please submit new records in STANDARD FORMAT (short manuscripts are acceptable when data cannot be adequately presented in standard format) to Joseph C. Mitchell, Dept. of Zoology, Arizona State University, Tempe, Arizona 85281.

Recommended citation: Jones, J. 1974. Geographic Distribution: Rana pipiens. Herp. Rev. 5(1):1.

TESTUDINES

DEIROCHELYS RETICULARIA MIARIA (Western chicken turtle). U.S.A., Oklahoma, Pattawatomie Co., 1.5 km SW Shawnee ; 10 May 1974; Jeffery H. Black. U. Oklahoma Museum, uncatalogued. New county record on northwest margin of range. Submitted by JEFFERY H. BLACK, Dept. of Biology, Oklahoma Baptist University, Shawnee, OKLA 74801.

KINOSTERNON SUBRUBRUM HIPPOCREPIS (Mississippi mud turtle). U.S.A., Oklahoma, Seminole Co., 7 km S Maude; 3 June 1974; Jeffery H. Black. U. Oklahoma Museum, uncatalogued. First record for county and extends range 48 km NW of previous northwestern most locality in Hughes Co. (Webb, 1970 , Reptiles of Oklahoma, U. Oklahoma Press). Submitted by JEFFERY H. BLACK.

STERNOTHERUS CARINATUS (Razor-backed musk turtle). U.S.A., Oklahoma , Seminole Co., 7 km S Maude; 17 May 1974; Roger Simpson. Jeffery H. Black. U. Oklahoma Museum, uncatalogued. Extends range 64 km N of previous western most record in Johnston Co. (Webb, 1970, Reptiles of Oklahoma, U. Oklahoma Press). Submitted by JEFFERY H. BLACK.

TERRAPENE CAROLINA TRIUNGUIS (Three-toed box turtle). U.S.A., Oklahoma, Garfield Co., 10.2 km SE Enid; 18 May 1974; 6.5 km S Covington; 8 Sept. 1974; R.L. Lardie. Collection of R.L. Lardie, alive and RLL 822, respectively. Extends range ca. 44 km NW of nearest Oklahoma records and connects a single most westerly record from Great Salt Plains Refuge, Alfalfa Co. (Webb, 1970, Reptiles of Oklahoma, U. Oklahoma Press). Associated species not previously reported from Garfield Co. are: Chrysemys scripta elegans (RLL 903), Eumeces fasciatus (RLL 874, 917, 921), Lygosoma laterale (RLL 909), Crotalus horridus (Collection of Kline farm), Diadophis punctatus aryni (RLL 922, 924, 928-9), Masticophis flagellum x testaceus (RLL 849, 876), Opheodrys aestivus majalis (RLL 875). Submitted by RICHARD L. LARDIE, Dept. of Biological Sciences, Oklahoma State University, Stillwater, OKLA 74074.

SAURIA

EUMECES MULTIVIRGATUS MULTIVIRGATUS (Many-lined skink). U.S.A., Nebraska, Greeley Co., 8 km W-NW Greeley; 3 July 1971; S.M. Moody and D.C. Moody. S.M. Moody and A.E. Greer. Harvard University, MCZ 128356. First record for county. Establishes intermediate locality between the northeastern most (Holt Co.) and southeastern most (Kearney Co.) previously known localities. Extends range 160 km east of previous known locality (Logan Co.) representing the central portion of range in Nebraska. Greeley Co. borders the southeastern most portion of the Sandhill-short grass prairie, characteristic habitat for this species. Submitted by SCOTT M. MOODY, Museum of Zoology, University of Michigan, Ann Arbor, MICH 48104.

GERRHONOTUS PANAMINTINUS (Panamint alligator lizard). U.S.A., California, Inyo Co., 13.7-15.8 km NE Big Pine; 24 June 1974; J.D. Dixon, Univ. of California, Berkeley, Mus. of Vertebrate Zoology, UCB 94720 (3). AOR specimens found between 2110 and 2140h suggest previously unrecorded nocturnal Activity. Extends known range into the White Mts., 74.1 km from previous northern locality, and increases altitudinal record from 1553 to 2072 meters (Banta, 1963, Occ. Papers Calif. Acad. Sci., (36): 1-12). Submitted by JAMES D. DIXON, 2326 Russell St., Berkeley, CA 94705.

SERPENTES

CEMOPHORA COCCINEA COPEI (Scarlet snake). U.S.A., Oklahoma, Johnston Co., Tishomingo National Wildlife Refuge, Public Game Management Area, 6.4 km S Tishomingo; 30 June 1974; R. L. Ball, Univ. Oklahoma Mus., uncatalogued. Extends Oklahoma range 113 km SW of nearest previous record on Seminole - Hughes Co. line (Webb, 1970, Reptiles of Oklahoma, Univ. Oklahoma Press). Submitted by ROBERT L. BALL, Dept. of Zoology, University of Oklahoma, Norman, OKLA 73069.

COLUBER CONSTRICTOR LATRUNCULUS (Black-masked racer). U.S.A., Mississippi, Washington Co., 8.8 km W Hollandale (T 15 N, R 7 W, Section 5); 20 July 1968, 28 May 1972, 2 June 1973. J.W. Cliburn. Univ. Southern Mississippi Dept. of Biology Collections, USM 74-1, 74-2 and not retained, respectively. First Mississippi records and most northerly location. Issaquena Co., 0.5 km W Mayersville (T 12 N, R 8 W, Section 3); 17 July 1972; D. Robinson. J.W. Cliburn. Univ. Southern Mississippi Dept. of Biology Collections, USM 74-3. First county record. Submitted by J. WILLIAM CLIBURN, Dept. of Biology, University of Southern Mississippi, Hattiesburg, MISS 39401.

SISTRURUS MILIARIUS STRECKERI (Western pigmy rattlesnake). U.S.A., Oklahoma, Pottawatomie Co., 6.4 km W Tribbey, 2 Aug. 1973; 2.4 km W Tribbey, 3 Aug. 1973; 3.2 km NE Tribbey, 5 Aug. 1973; 4.8 km W Tribbey, 5 Aug. 1973; 9.7 km W Tribbey, 6 Aug. 1973; 3.2 km E Macomb, 14 Sept. 1973; R.L. Ball. Univ. Oklahoma Mus. of Zoology, uncatalogued. Established county record on NW margin of range (Webb, 1970, Reptiles of Oklahoma, Univ. of Oklahoma Press). Submitted by ROBERT L. BALL.

TANTILLA NIGRICEPS NIGRICEPS (Plains black-headed snake). U.S.A., Oklahoma, Garfield Co., 9.5 km E Bison; 4 May 1974; 24 May 1974 (2); R.L. Lardie, Collection of R.L. Lardie, RLL 1085, 1034-5, respectively. Extends range 101 km NE of nearest previous record in Dewey Co. and 102 km SE of a record in Woods Co. (Webb, 1970, Reptiles of Oklahoma, Univ. Oklahoma Press). Associated species not previously recorded for Garfield Co. are: Crotaphytus collaris collaris (RLL 1071); Holbrookia maculata maculata x perspicua (RLL 1072-4), Lampropeltis getulus holbrooki (RLL 1037), Sonora episcopa episcopa (RLL 1015 - 33), Thamnophis sirtalis parietalis (RLL 1088). Submitted by RICHARD L. LARDIE. Dept. of Biological Sciences, Oklahoma State University, OKLA 74074.

THAMNOPHIS ELEGANS VAGRANS (Wandering garter snake). U.S.A., Colorado, Elbert Co., 13 km W Limon; 16 July 1973; J.E. Gillis. J.R. Scott. Not preserved. An approximate 64 km eastward extension and a new county record. Submitted by JOHN E. GILLIS, Dept. of Zoology-Entomology, Colorado State University, Fort Collins, COLO 80523.

NEOTROPICAL RESEARCH NEWS

JAIME VILLA (Cornell University) will be spending this next year in Central America and Mexico, studying the symbiosis between unhatched tree-frogs and parasite-like flies. He will also be Visiting Professor at the Universidad Nacional Autonoma, Nicaragua.

CATALOG OF AMERICAN AMPHIBIANS AND REPTILES

As of the date of this publication, 163 numbers of the Catalogue have been issued. A large proportion of the species living north of Mexico have been assigned to authors, but there still remain many species unassigned. Species for which we do not have authors are these:

SALAMANDERS: *Desmognathus fuscus, Ensatina eschscholtzii.*

FROGS: *Acris gryllus, Bufo americanus, B. debilis, B. marinus, B. microscaphus, B. punctatus, B. quercicus, B. terrestris, Hyla arenicolor, H. cadaverina, H. chrysoscelis, H. regilla, H. versicolor, H. wrightorum, Limnaoedus ocularis, Pseudacris clarki, P. nigrita, P. ornata, P. triseriata, Rana berlandieri, Scaphiopus intermontanus.*

CROCODILIANS: *Crocodylus acutus.*

TURTLES: *Caretta caretta, Eretmochelys imbricata, Kinosternon flavescens, K. hirtipes, Lepidochelys olivacea, Sternotherus carinatus, S. minor, Terrapene ornata, T. carolina.*

LIZARDS: *Anolis carolinensis, Callisaurus draconoides, Cnemidophorus burti, C. dixoni, C. exsanguis, C. flagellicaudus, C. gularis, C. inornatus, C. laredoensis, C. scalaris, C. sonorae, C. tesselatus, C. velox, Cophosaurus texanus, Crotaphytus collaris, C. insularis, Dipsosaurus dorsalis, Eumeces anthracinus, E. gilberti, E. septentrionalis, Gonatodes albogularis, Leiocephalus carinatus, Phrynosoma cornutum, P. coronatum, P. douglassii, Sceloporus cyanogenys, S. graciosus, S. grammicus, S. jarrovii, S. magister, S. poinsetti, S. scalaris, S. undulatus, S. variabilis, Urosaurus microscatatus, U. ornatus, Uta stansburiana.*

SNAKES: *Chilomeniscus cinctus, Chionactis occipitalis, C. palarostris, Coniophanes imperialis, Contia tenuis, Crotalus atrox, C. cerastes, C. horridus, C. mitchelli, C. molossus, C. ruber, C. scutulatus, C. tigris, C. viridis, Diadophis punctatus, Farancia abacura, F. erythrogrammus, Heterodon nasicus, H. platyrhinos, H. simus, Hypsiglena torquata, Lichanura trivirgata, Masticophis bilineatus, M. lateralis, M. taeniatus, Opheodrys aestivus, O. vernalis, Pituophis melanoleucus, Regina alleni, R. grahamii, R. septemvittata, Salvadora deserticola, S. hexalepis, Sistrurus catenatus, Sonora episcopa, S. semiannulata, Storeria dekayi, S. occipitomaculata, Tantilla coronata, T. cucullata, T. nigriceps, T. rubra, T. wilcoxi, Thamnophis butleri, T. couchii, T. cyrtopsis, T. elegans, T. eques, T. ordinoides, T. radix, T. rufipunctatus, T. sirtalis.*

****

We invite anyone wishing to volunteer to produce a Catalogue account of one of these species to contact the appropriate Section Editor: SALAMANDERS--Dr. J.D. Anderson, Dept. of Zoology, Rutgers State Univ., Newark, NJ 07102; FROGS--Dr. R.G. Zweifel, Dept. of Herpetology, American Museum of Natural History, Central Park West at 79th St., New York, NY10024; CROCODILIANS--Dr. H. Campbell , National Fish and Wildlife Lab., 2820 E. University Ave., Gainesville, FL 32601; TURTLES--Dr. G. Zug, Division of Reptiles/Amphibians, National Museum of Natural History, Washington, DC 20560; LIZARDS--Dr. C. J. McCoy, Dept. of Herpetology, Carnegie Museum, Pittsburgh, PA 15213; SNAKES--Dr. L.D. Wilson, Division of Intercurricular Studies, Miami-Dade Community College, South Campus, 11011 S.W. 104th St., Miami, FL 33156.

The Section Editors also will welcome volunteers for generic accounts.

The scope of the Catalogue extends southward beyond the International Boundary. Authors who may wish to write accounts of species in the Caribbean, Mexican or Central American regions are urged to contact a Section Editor.

Richard G. Zweifel, Gen. Ed.

SOCIETY FOR THE STUDY OF AMPHIBIANS AND REPTILES

PRIZE FOR BEST STUDENT JOURNAL PAPER

An annual prize of $100 was established in 1973 to be awarded to that student publishing the most significant paper in the *Journal of Herpetology* during the preceding year. This award is to serve a dual purpose: (i) to recognize the important, original contributions made to our knowledge of amphibian and reptile biology by young persons; and (ii) to encourage students to publish in *Journal of Herpetology*. Unlike awards for oral presentations, which require the presence of the person at a particular meeting site in order to compete, this prize is open to all students throughout the world and thus is more fitting for a society having an international focus.

COMMITTEE

1. An *ad hoc* Prize Committee of five persons will be appointed by the Society Chairman early each year.
2. The Committee should be international in composition. Since Committee members will need to have the relevant *Journal* issues at hand, this should be noted in appointing non-American members.

ELIGIBILITY

1. A person must have been a student at an accredited school (elementary, secondary or university level) within one year of submitting the manuscript for publication. Submission dates can be verified by the Editor of the *Journal*.
2. The Committee Chairman should designate all articles to be considered. This list should be all-inclusive, even including those articles where author eligibility is possibly in doubt. After the vote, the highest-ranking, eligible person can be identified.

CRITERIA

1. The prize should be awarded to that person reporting the most significant new contribution to our knowledge of amphibian or reptile biology, interpreted in its broadest sense.
2. If the Committee so chooses, "no winner" may be declared.

AWARD

1. The Committee's decision should be reported to the Society's Chairman and Treasurer by June 1.
2. The Society Chairman will notify the awardee as soon as possible.
3. The award will be presented at that summer's Annual Meeting; it is hoped that the student will be present to accept the award.

COLORADO HERPETOLOGICAL SOCIETY

THE COLORADO HERPETOLOGICAL SOCIETY has survived the formative stages and is now a viable organization just over two years old-dedicated to education and conservation in the field of Herpetology.

THE SOCIETY PROVIDES a means for those with a common interest in Herpetology to meet and exchange ideas and information on a regular basis. Meetings are once a month and a Newsletter is published once a month. A Bulletin is published at least once each year.

MEETINGS ARE: The third Sunday of each month. Usually at The Denver Zoo. Occassionally at CU in Boulder. Board Meetings are on the following Friday. Location and other information is included in the Newsletter. Public is welcome and encouraged to come to any and all meetings. In 1974 two-Slide, Narrative and Comprehensive Live Display Programs-were presented in Denver by the Society.

MEMBERSHIPS ARE:

PRIMARY	(Voting rights & Publications)	$7.50
SECONDARY	(2nd in family -No Publ)	$2.50
ADDITIONAL SEC	(3rd in family, etc)	$1.00
JUNIOR	(Voting rights & Publication)	$7.50
SUBSCRIBING	(Publications only)	$5.00

SOME FUTURE PROGRAMS OF INTEREST WILL BE:

-Reptile Behavior Patterns
-Security of Reptiles in Zoos
-Relation of Reptiles to Man
-Wildlife Photography
-Parthenogenic Lizards
-Galapagos Slide Show

OFFICERS FOR 1975 ARE:

President -	Martin Bolt	Littleton	794-3347
Vice Pres -	Ray Horst	Denver	757-4788
Secretary -	Louise Turner	Wheat Ridge	422-5134
Treasurer -	Eve Birgen	Westminster	429-8295

A GUIDE TO THE SNAKES OF UGANDA

REVISED EDITION BY CHARLES R. S. PITMAN

312 pp. with 29 coloured plates, 22 plain plates and 2 maps, crown 4to, cloth bound.

The author has now completely revised the text and 5 new coloured plates have been added, so that the new edition of this standard work is completely up to date. As the only comprehensive work on the snakes of any part of Africa north of the Zambesi it has an importance far beyond the confines of Uganda. **Price $29.00**

THE REPRINT EDITION OF

FAUNA OF BRITISH INDIA REPTILIA AND AMPHIBIA

Vol. 1 Loricata, Testudines & Vol. 2 Sauria

Vol. 1

FAUNA OF BRITISH INDIA — REPTILIA and AMPHIBIA — Loricata Testudines, By Malcolm A. Smith (1931) (Reprinted 1973) *P.p. i-xxvii, 1-185, 2 plates, map, 42 text figs. I.S.B.N. 0-88359-005-0* 15.00

Vol. 2

FAUNA OF BRITISH INDIA — REPTILIA and AMPHIBIA — Sauria By Malcolm S. Smith (1935) (Reprinted 1973) *P.p. i-ix, 1-440, 2 maps, 1 plate, 94 text figures.* 22.50

PRICE FOR THE SET — VOLS. 1 & 2..... **$35.00**

The Two Volumes cover the Lizards, Turtles, Tortoises and Crocodiles of the area of Southern Asia.

A Two Volume, quality reprint, of a Classic Work, long out-of-print and scarce, bound in maroon cloth, gold stamped. Each Volume contains keys, descriptions, ranges and habits on each species. A Glossary of technical terms, bibliographies, separate alphabetical and systematic indexes, and maps of the area are included in each Volume. Excellent, detailed line illustrations and three pages of plates are faithfully reproduced.

REPTILIAN DISEASE:
Recognition and Treatment
J. S. Dobbs

A much needed book written by a professional reptile keeper in language that the amateur reptile keeper can understand and yet in such detail that the professional keeper will find this book invaluable in maintaining a healthy reptile collection. Chapters on basic maintenance techniques, parasites, internal & external disorders, etc. Describes 'what to look for' and 'how to treat it'. Gives lists of medication and how to use them. Contains more useful information than that found in many larger and more expensive publications.
46 pages with 7 illustrations. Color cover. Price $1.95

Ralph Curtis Books publishes and distributes non-fiction books on wildlife. To receive free catalogs regularly, please ask that your name be added to our mailing list.

The University of Kansas Museum of Natural History announces fall 1975 publication of the latest volume in its monograph series entitled

Edward H. Taylor: Recollections of A Herpetologist

and containing

- Philippine Adventures: An Autobiographical Memoir by Dr. Taylor
- Edward Harrison Taylor: The teacher by A. Byron Leonard
- The Blazing of a Trail: The Scientific Career of Edward Harrison Taylor by Hobart M. Smith
- The Published Contributions of Edward H. Taylor by George R. Pisani

Post-publication retail price will be $6.00 including handling charges. A special prepublication price of $5.00 including postage and handling will be in effect until 1 October 1975.

VENOMOUS ANIMALS AND THEIR VENOMS

"A book which contains in detail the biochemical, pharmacologic and toxicologic aspects of venoms, and also includes the medical aspects such as envenomation, pathologic findings, and therapeutic procedures, is unique in our day. Never has such a publication concerning venomous animals been available before. For those working in venom research, it could be considered a 'bible'."—Herschel H. Flowers, *American Veterinary Medical Association*

VOLUME 1/**VENOMOUS VERTEBRATES**
edited by WOLFGANG BÜCHERL and
ELEANOR E. BUCKLEY

CONTENTS: Venomous Snakes. The Chemistry, Toxicity, Biochemistry, and Pharmacology of North American Snake Venoms. Chemistry and Pharmacology of the Venoms of Bothrops and Lachesis. Venomous Saurians and Batrachians. Venomous Fishes.

1968, 707 pp., $47.00/£22.60; subscription price: $39.00/£18.70

VOLUME 2/**VENOMOUS VERTEBRATES**
edited by WOLFGANG BÜCHERL, ELEANOR E. BUCKLEY, and VENANCIO DEULOFEU

CONTENTS: Venomous Mammals. Venomous Snakes: General Information; Venomous Snakes of the World; Venomous Snakes of Central and South Africa; Venomous Snakes of East Asia, India, Malaya, and Indonesia.

1970, 687 pp., $47.00/£22.60; subscription price: $39.00/£18.70

VOLUME 3/**VENOMOUS INVERTEBRATES**
edited by WOLFGANG BÜCHERL and
ELEANOR E. BUCKLEY

CONTENTS: Venomous Insects. Venomous Centipedes, Spiders, and Scorpions. Venomous Mollusks. Venomous Coelenterates, Echinoderms, and Annelids.

1971, 560 pp., $43.00/£20.65; subscription price: $36.00/£17.30

BIOLOGY OF THE REPTILIA

series editor: CARL GANS

This multi-volume treatise presents a comprehensive review of the class Reptilia. It is divided into sectons on morphology, embryology and physiology, and behavior and ecology. Each chapter gives a complete summary of present knowledge of a particular topic in reptiles, is written by a specialist with first-hand experience on the topic, and is intended for those who have a minimal background in the area concerned. Special topics will be of interest to anatomists and physiologists.

VOLUME 1/**MORPHOLOGY A**
edited by CARL GANS, A. d'A. BELLAIRS, and
THOMAS S. PARSONS

1969, 390 pp., $17.50/£6.50; subscription price: $14.85/£5.60

VOLUME 2/**MORPHOLOGY B**
edited by CARL GANS and THOMAS S. PARSONS

1970, 388 pp., $17.50/£6.50; subscription price: $14.85/£5.60

VOLUME 3/**MORPHOLOGY C**
edited by CARL GANS and THOMAS S. PARSONS

1970, 400 pp., $21.00/£7.00; subscription price: $17.85/£6.70

VOLUME 4/**MORPHOLOGY D**
edited by CARL GANS and THOMAS S. PARSONS

1973, 528 pp., $39.50/£14.00; subscription price: $33.50/£12.70

BOOK REVIEW

NOTES ON THE HERPETOFAUNA OF SURINAM IV. THE LIZARDS AND AMPHISBAENIANS OF SURINAM. 1973. M. S. Hoogmoed. X + 420 pp., 81 figs., 42 photographs, 30 tables, Dr. W. Junk, publisher.

This text is destined to become the definitive reference to the lizards and amphisbaenians of Surinam and of adjacent areas. Four families of lizards, comprising 7 species of geckos, 12 iguanids, 1 scincid, and 20 teiids, plus 3 species of amphisbaenians are discussed and described in exquisite detail. Each account includes photographs of the whole animal, from different aspects, and detailed drawings of the scalation. Keys to the families, genera, and species are provided. The distribution of each species is plotted and all the specimens examined (from world-wide depositories) are listed with tabular scale counts. Following the descriptive diagnosis, there are data on the known habits and natural history of the reptile. Ranges outside Surinam are delimited.

The taxonomist will find 2 new subspecies described. Three completely and one partially unisexual species of lizard are signalized. The introductory chapter provides a concise history of the collectors and expeditions for lizards in Surinam plus a discussion of faunal relationships with especial comparison to Parker's 1935 work on Guyana (= British Guiana) lizards. There is a complete bibliography and index. This book is a must for biogeographers, students of lizards, and for those who are just interested in Surinam.

-- H. C. Seibert, Dept. of Zoology , Ohio University, Athens, Ohio 45701.

CURRENT LITERATURE

NOTICE: The Current Literature project is now being handled by the Milwaukee Public Museum. All searchers: Please note the change in address.

As of July 1974, 59 searchers are scanning a total of 408 journals.

Searchers: As the titles will be published 4 times per year, try to send your titles in at least 4 times a year to have an approximately equal listing each issue in HR.

Due to lack of space in this issue, an updated list of journals is not included. Such an updated list is scheduled for next issue, budget permitting.

Any questions, comments, etc. should be sent to:

GUIA DE LOS ANFIBIOS Y REPTILES ESPANOLES. By Alfredo Salvador. 282 p. Publication of the Instituto Nacional para la Conservacion de la Naturaleza, Ministerio de Agricultura. Available from Estacion Central de Ecologia ICONA, Carretera de la Coruna Km. 7, Madrid 35, Spain. Price 500 Ptas. (= $9.00).

No publication form in herpetology stimulates greater interest than a well-executed field guide. Tantalizingly terse summaries of life histories demand further study, range maps challenge the collector to verify or add to them, and a comprehensive set of illustrations satisfies the innate need to grasp natural diversity. In my own case the stimulus was Schmidt and Davis' "Field Book of Snakes," and later generations have been impelled by the Conant and Stebbins guides in the Peterson series. Compared with these volumes, classics of their kind, Alfredo Salvador's "Guide to Spanish Amphibians and Reptiles" holds its own.

The guide treats 73 species of amphibians and reptiles occurring on the Iberian Peninsula, the Balearic Islands, and the Canary Islands. Each species account includes a diagnostic description, size data, a succinct summary of the major aspects of biology of the species, and a review of the distribution. The descriptions and the biological data are more elaborate and inclusive than usually found in a field guide, and provide an excellent introduction to each species. For example, such details of life history as size and number of eggs, and length of larval life are given for the amphibians. A shaded range map is inserted in the account of each species, saving a lot of thumbing to another part of the book.

Color plates depicting all species are interleaved with the species accounts. The illustrations are not the diagnostic drawings usually found in a field guide, but more on the order of portraits of the species. They are superbly executed, and undeniably attractive, but vary in effectiveness as identification tools. Appended to the species accounts is a systematic catalog of the fauna, including subspecies, with synonymies for all forms. Salvador has annotated this catalog with pertinent comments on geographic variation and taxonomic problems in various species. For anyone who has wrestled with the fragmented literature of Balearic Lacerta this section alone is worth the price of the book.

Other departures from customary field guide format are a discussion of the zoogeography of the Iberian fauna, and a key to the species. The section on zoogeography, necessarily short, suffers because of its brevity. The keys are well-illustrated with line drawings, and appear to be based on easily determined characters. As a further fillip, there is a short review of the general biology of amphibians and reptiles preceeding the species accounts of each group.

It is difficult to find fault with this guide. The distribution maps would have been more effective with provincial boundaries included, and a section on physical and political geography of the Iberian Peninsula is needed. But these are minor and essentially personal criticisms. Alfredo Salvador can take pride in this beautifully realized work, the only modern field guide to any segment of the European herpetofauna.

Milwaukee, Wisconsin 53233

The Missouri Prairie Foundation (P.O. Box 200, Columbia, Missouri 65201) is actively engaged in prairie conservation. Since 1966 four areas of virgin tall grass prairie totaling 557 acres have been preserved. These areas, in the tall grass prairie - deciduous forest tension zone, are managed to retain their grassland characteristics. The MPF is now trying to expand its holdings to include remnants of short grass prairies located on the loess hills along the Missouri River. These tall grass and short grass prairie preserves provide suitable habitats for a number of herptiles typical of the central United States. Contributions to the Missouri Prairie Foundation (regular membership $5 and above; student membership $3) would aid in expanding this effort. Biologists are encouraged to use these areas for approved scientific studies.

O. J. Sexton
President, MPF

The last complete sets of A Statistical Study of the Rattlesnakes (5 papers totaling 255 pages) by L.M. Klauber are available from the San Diego Natural History Museum for $2.50 postpaid. These papers were published between 1935-1940 as Occas. Papers of the San Diego Soc. Nat. Hist. and were one important base on which Klauber's definitive work concerning Rattlesnakes was written. Address orders to:

Librarian
San Diego Natural History Museum
P.O. Box 1390
San Diego, CA 92112

Clifford H. Pope's set of Herpetologica (complete through 1974 except 4(5), 6(3) and 14(4) is available to the highest bidder (bidder pays postage). Contact:

STATUS AND CONSERVATION OF THE GHARIAL (Gavialis gangeticus)

During three months of the period from October 1973 to May 1974, members of the Madras Snake Park Trust and Conservation Centre covered approximately 5,000 kms. in the range of the gharial interviewing local people and making field investigations. During this period a total of only six wild gharial were seen by us.

Shri Ranjitsinh, Deputy Secretary to Government (Wildlife), refers to the gharial as one of the five most endangered Indian animals. Killing for its skin is the most important reason for the rapid decline in numbers, and at present fishermen with nets are a very serious threat. The skin of a 12' animal may bring in Rs. 800 (U.S. $104.00) which represents at least half a year's Indian wages.

The increase in river activity by way of fishing, transport and agriculture has limited Gavialis gangeticus habitat to a very few remaining wild areas. Major alteration of rivers by earthquakes, dams, canal diversions, artificial embankments and increased siltation through erosion are other reasons for the decline. The fact that we were unable to see more than a few gharial after extensive stays at river stretches described as "teeming with crocodilians" forty years ago indicates the rapid change that has taken place.

Gharial are shot at, netted and prevented from basking in all but the most remote places and today there are a very few spots free from commercial fishing and other river activities. The gharial is a river animal and there is very little evidence that it lives and breeds in the still waters of lakes and ponds.

Status

In 1921 Shortt (J. Bombay Nat. Hist. Soc.) wrote a note about hunting mugger and gharial in North India and described the Kosi River as "teeming with reptiles" and a parallel river, the Sathar Dhar as "full of crocodiles of both classes". Other early gharial observers, such as Hornaday and Champion clearly indicate that the northern river systems had large Gavialis populations. In 1880 Hornaday (Two Years in the Jungle, New York) wrote that he could count 64 gharial in two hours on the banks of the Yamuna.

Now, almost a century later, the gharial is on the brink of extinction. Prior to the Madras Snake Park investigation, J.C. Daniel (Curator of the Bombay Natural History Society), S. Biswas (Zoological Survey of India) and S.P. Shahi (Chief Conservator of Forests, Bihar) have done survey work on the gharial and all evidence points of the extreme rarity of the animal and the dubious chances of its survival.

Conservation

1. Further and more detailed investigation of the status of Gavialis gangeticus and its present distribution.

2. Location of populations in protected areas such as sanctuaries and Reserve Forests under Forest Department control and within reservoirs and lakes under Fisheries Department. Designation of these areas as gharial preserves.

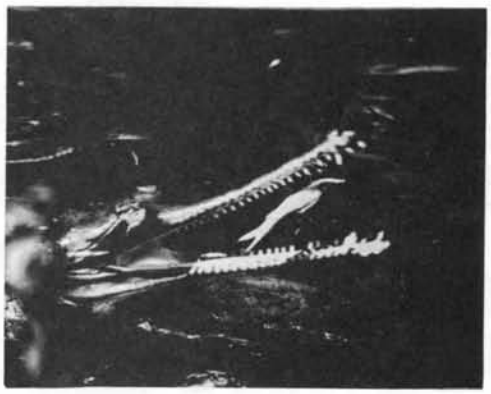
3. Capture and removal of individual gharial which still exist in populated areas and are therefore likely to be killed, to protected areas.

4. The establishment of a captive or semi-captive breeding stock of Gavialis, preferably near original riverine habitat, collection of eggs, rearing of young.

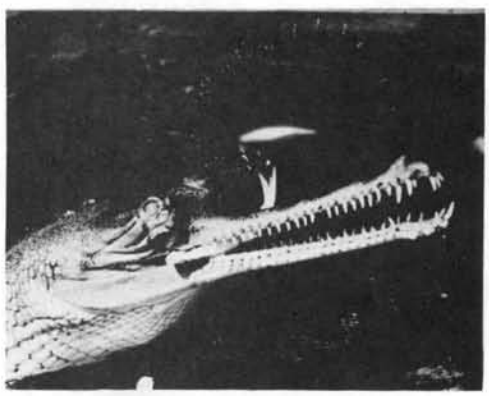
5. Publicity for gharial in English and vernacular papers and magazines. Official notification to authorities and public by State and Central Forest and Fisheries Departments.

6. Investigation and reports to State Wildlife Officers by Divisional Forest Officers and Forest Range Officers in the field.

Export of crocodilian skins has been banned by the Central government since 1958 and various states had banned crocodilian killing years prior to the order. However, the depletion of these animals has continued unabated to the present drastic situation. The Wildlife Protection Act of 1972 gives Gavialis complete protection but will be ineffectual unless a special effort is made to publicize the law and afford real field protection in the few areas where it can continue to survive.



A river with gharial, an important predator/scavenger of great antiquity, is a sign of a healthy, ecologically balanced environment.



The Madras Snake Park wishes to cooperate in a comprehensive all India program for the conservation of gharial and extends this offer to the concerned authorities of the various (Indian) states.

NEW PUBLICATIONS

ILLUSTRATED GUIDE TO AMPHIBIANS AND REPTILES IN KANSAS--AN IDENTIFICATION GUIDE by Daryl Karns, Ray Ashton, and Tom Swearingen. Published by: The Museum of Natural History and the State Biological Survey, University of Kansas, Lawrence.

The Illustrated Guide to Amphibians and Reptiles presents a new technique in identifying animals in the field. This new technique includes the use of simple characteristics, clear drawings, and a flow chart design which permits easy identification of amphibians and reptiles. The twenty-five page booklet includes 15 charts, 83 figures and identifies nearly 85% of the amphibians and reptiles in Kansas. It is available at a cost of $1.00 for single copies or $ .50/copy for orders of 100 or more for educational organizations. Order from:

Publications Secretary

WEST INDIAN PUBLICATION

EARL G. LONG (formerly of the Rockefeller Foundation Schistosomiasis Lab in Castries, St. Lucia; now finishing his degree in parasitology at the London School of Hygiene and Tropical Medicine) has recently put out an interesting booklet entitled, "The Serpent's Tale. Reptiles and Amphibians of St. Lucia" (Iouanaloa Ser., No. 2, ix 46 pp., September 1974). Although primarily aimed at educating St. Lucians about the reptiles and amphibians around them, this paper is the only currently available summary of the herpetofauna of St. Lucia.

The paper contains sections on pronunciation of scientific names, the nomenclature and origin of the fauna, and most valuably, firsthand observations on the ecology, behavior, distribution, conservation and folklore of St. Lucian amphibians and reptiles.

Earl is a native St. Lucian whose interest in the fauna of his island is exceeded only by the assistance and generosity he extends to visiting biologists. Despite the difficulty of obtaining pertinent references to the eastern Caribbean, Earl has produced a most creditable paper.

Available from:

U.W.I. Extra Mural Department
P.O. Box 306, Castries
St. Lucia, West Indies

$2.00 U.S. and Jamaican,
90p U.K. and
$4.00 Eastern Caribbean

A new list of Carnegie Museum publications on reptiles and amphibians, 1901-1974, is available from the Section of Amphibians and Reptiles, Carnegie Museum of Natural History, 4400 Forbes Ave., Pittsburgh, PA 15213.

NEOTROPICAL NEWS

A new serpentarium has been instituted at the Universidad de Antioquia's Medical School (Medellin, Colombia). Dr. RODRIGO ANGEL is studying the histochemistry of the venom gland in some Bothrops, especially the terciopelo (B. atrox). His future plans include research on the toxicity of Colombian snakes and the preparation of antivenins. Dr. Angel is also working closely on another terciopelo project with the ROGER BOLANOS group in the Instituto Clodomiro Picado of Costa Rica(see Herp. Review 5(2):36-37, 1974).

The Centro de Zoologia Aplicada(Cordoba, Argentina, Apartado 122) is actively working to produce a catalogue of the snakes of the Cordoba Province. Director Dr. JORGE ABALOS and herpetologists ISMAEL di TADA and RICARDO MARTORI are also studying the herpetofauna of the Pampa de Achala (Cordoba Prov.), which is known to have many interesting Andean-Patagonian relicts. A very important section of the Centro is a serpentarium, where antivenin is produced. More about this in a future issue.

MIGUEL ALVAREZ DEL TORO (Instituto de Historia Natural, Tuxtla Gutierrez, Chiapas, Mexico) is continuing his research on the Chiapan herpetofauna, which still yields surprises. In addition, he is starting a natural-history study of the turtle Dermatemys mawii, which may lead to intensive breeding for commercial purposes. A second edition of his "Reptiles de Chiapas" (see Bogert's review of first edition in Copeia 1961:506) appeared in 1972; it is essentially a new book, with abundant new information and many new photographs. Copies are available from the Instituto de Historia Natural (Cost: US $10; send money orders only).

SIXTH LATIN AMERICAN ZOOLOGICAL CONGRESS

The VI Congreso Latinoamericano de Zoologia was held in Mexico City, September 30 through October 5, 1974. Among herpetologists attending the Congress were Marcos A. Freiberg, Jose Maria A. F. Gallardo, and Osvaldo A. Reig (Argentina), P. E. Vanzolini (Brazil), Fabio Heredia Cano (Colombia), Sixto J. Inchaustegui (Dominican Republic), Ticul Alvarez, Gustavo Casas, R. Marquez, and R. Martin del Campo (Mexico), W. Frank Blair, Orlando Cuellar, and C. J. McCoy (USA), and Federico Achaval, Miguel A. Klappenbach, and Raul Vaz-Ferreira (Uruguay).

Symposia on the program included "Population Ecology and Genetics," "Evolution of Vertebrate Faunas During the Cenozoic," and "Evolution and Modern Taxonomy of Amphibians." In the population genetics symposium Reig discussed the ecological significance of variation in karyotype, using several examples from amphibians and reptiles. Dr. Rosendo Pascual (Argentina) included data on reptiles and amphibians in a synthesis of the origin and evolution of South American Cenozoic vertebrates.

The symposium on amphibian evolution and taxonomy was opened by Reig, who reviewed fossil evidence of anurans and presented a revised classification of the group. Gallardo discussed the taxonomic importance of behavior in the Amphibia. Blair reported preliminary results of studies comparing the ecology of desert anuran faunas in northwestern Argentina and southwestern United States. Cano described field experiments in hybridization of *Bufo blombergi* and *Bufo marinus* in Colombia.

Other herpetological papers on the program were: *Helicops carinicaudus infrataeniatus* in Uruguay, F. Achaval and Claudio Stern; Reproductive behavior in captivity of Hispaniolan turtles of the genus *Chrysemys*, S. Inchaustegui;

Morphometric characteristics of adults, hatchlings, and hybrids, and geographic distribution of *Chrysemys decussata vicina* in Hispaniola, S. Inchaustegui; Nesting habits of *Lepidochelys olivacea* and *L. kempi* on the coasts of Jalisco, Oaxaca, and Tamaulipas, Mexico, G. Casas-Andreu; Protection of the Young in Leptodactylidae, R. Vaz-Ferreira.

A meeting of the Latin American Association of Ichthyologists and Herpetologists (ALAIH) held during the Congress produced a large and enthusiastic response. The organizers of the Congress were Dr. Hector Mayagoitia Dominguez (President), and r. Gonzalo Halffter (General Coordinator).

On 21 June 1974 the Pennsylvania Fish Commission announced that legislation was desirable in the Pennsylvania General Assembly to give the Commission jurisdiction over all amphibians and reptiles, besides fish. The proposed legislation would give the Fish Commission power to promulgate rules necessary to conserve, protect or "assure the future" for amphibians and reptiles which might become rare and endangered. Without this legislation, there can be no assessment by the Fish Commission or any state agency to determine the status of various species of herps. (Pennsylvania Fish Commission News).

* * * * * * * * *

PENNSYLVANIA CONSERVATION NEWS

During the 1974 session the General Assembly of Pennsylvania enacted legislation to provide legal protection for all native amphibians and reptiles. An amendment to the "Fish Law of 1959" authorizes the Pennsylvania Fish Commission to"regulate, control, manage, and perpetuate" amphibians and reptiles. In the past, the Commission has

regulated only the taking of tadpoles, bullfrogs, and aquatic turtles. The new legislation extends Commission jurisdiction to all amphibians and reptiles "living free in nature" in the state.

Other important parts of the act empower the Commission to make rules and regulations for both taking and possession of amphibians and reptiles, to set seasons and possession limits, and to issue collector's permits for educational and scientific purposes. The responsibility for protection of rare and endangered species of amphibians and reptiles is also given to the Fish Commission, and fines are set for violation of any regulations that may be established.

In another action the Pennsylvania Fish Commission has declared an indefinite closed season on four species of aquatic turtles that are rare or endangered in the state. The protected species are Blanding's turtle (Emydoidea blandingi), Smooth softshell (Trionyx muticus), Red-bellied turtle (Chrysemys rubriventris), and Eastern mud turtle (Kinosternon subrubrum). All four species are "peripheral" and enter the state in limited areas. Blanding's turtle and the Smooth softshell are rare in Pennsylvania - neither has been taken in the state since around 1900. Pennsylvania populations of the Red-bellied turtle and Eastern mud turtle are threatened by industrial development and urbanization of the Delaware River Valley. These four species join the Bog turtle, protected by special act in 1974 (Herp.Rev. 5:44), on the "collecting prohibited" list.

ANOMALIES IN ADULT BUFO ARUNCO AND LARVAL CALYPTOCEPHALELLA CAUDIVERBERA

Alfredo Salibian and Jorge Cabrera

Descriptions of anomalies of Chilean anurans are not frequent, but there are reports of atrophic oviducts and partial albinism in adult Pleurodema bibroni, coxigeous sacralization in Calyptocephalus gayi and syndactyly and brachydactyly in P. bibroni (Capurro, 1953, 1955; Cei, 1958; Marelli, 1927).

The present communication describes two anomalies not previously reported in our amphibian fauna. Both findings correspond to specimens taken in June, 1973, in the Piscicultura de Curico, Servicio Agricola Ganadero, Republica de Chile.

We captured a "one-eyed" juvenile male specimen of the Chilean toad Bufo arunco with a series of normal toads. We kept the captive toad alive for several weeks in our laboratory, at room temperature. It was force fed frozen slices of beef liver.

The "absent" eye was actually located inside the buccal cavity (Figures 1 and 2) and was morphologically complete. Dr. H. Maturana made preliminary measurements on that eye and was able to show that it was physiologically normal and active. No cicatrice was observed and the area in the skull corresponding to the ocular globe was covered with skin with characteristics undistinguishable from other regions of the dorsal skin.

The other anomaly was a semi-albinistic larval Calyptocephalella caudiverbera (= C. gayi). This is a very rare anomaly. The captured tadpole was in stage 42 (Gosner, 1960) (Figure 3). The slight pigmentation was limited to the anterior end and the remaining part of the skin was pale yellowish. It was captured in a large fishpond containing approximately 5,000 "normal" larvae. This suggests the very low incidence of this anomaly in that population.

Capurro (op. cit.) and Cei (op.cit.) have interpreted the anomalies found in P. bibroni as "probable mutational" in origin. The same interpretation could apply to the semi-albino reported herein. However, an early accident, other than genetical, may have caused the anomaly in the "one-eyed" B. arunco.

Figure 1.-- "One-eyed" Bufo arunco collected in Curico, Chile.

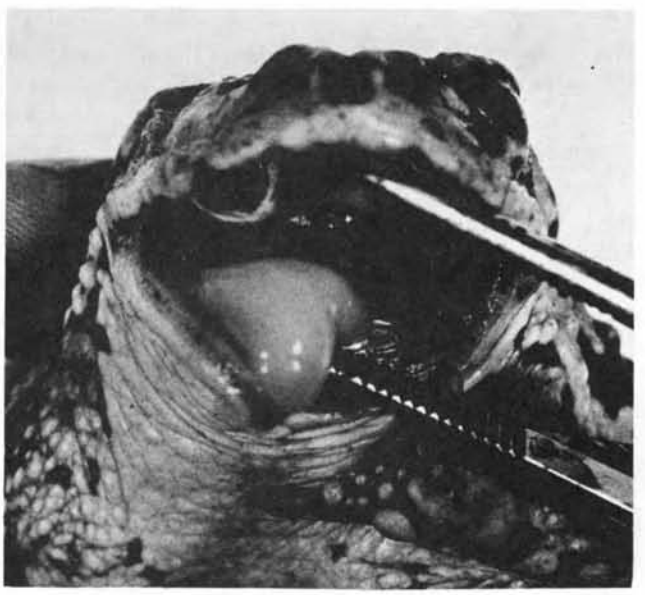

Figure 2.-- The same specimen of Figure 1; the "absent" eye is actually inside the buccal cavity.

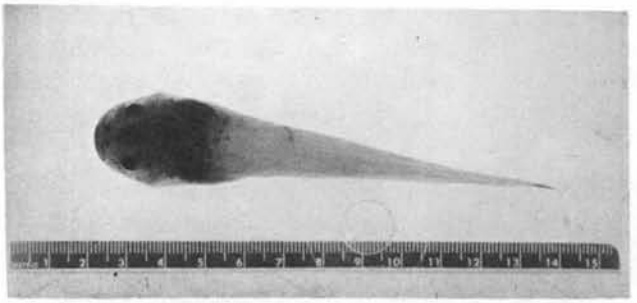

Figure 3.-- Dorsal view of a semi - albinistic Calyptocephalella caudiverbera tadpole from Curico, Chile.

The Second Recorded Occurrence of an Albino Thamnophis radix radix (Baird and Girard)

Hensley (1959) records the only albino Thamnophis radix radix as being collected in the Chicago area, Cook County, Illinois. This specimen was described by May (1952) as being a partial albino or amelanistic. It lacked melanophores although it had yellow reflecting guanophores.

The second specimen was collected by Laura Strezo on 21 September 1973 in the western suburbs of Chicago. The specimen was a newborn female with a snout-vent length of 196mm and a tail length of 39mm. It had pink eyes , tongue, and ground color. In life the dorsal stripe was a pale yellowish-orange and the lateral stripes were pale yellow. The belly was dull white. Paired yellow occipital spots were prominent on the head.

Lepidosis agreed closely with T. radix as described by Smith (1961). The specimen is now in my private collection (SD-058). Acknowledgement: I thank Harry W. Greene for critically reviewing the manuscript.

MARKING ANURANS WITH SILVER NITRATE

Branding of individual amphibians is desirable for determining population estimates and migratory habits. Marks should be inexpensive, reliable, easily applied with a minimum of equipment, and should not affect normal behavior.

Brands made by silver nitrate were identifiable on marine polychaete annelids for over 30 days (Klawe, 1954), on eel (Anguilla anguilla) for over 5 months (Harder et al., 1962) and on carp (Cyprinus carpio) for over 18 months (Zarnecki, 1963). Channel catfish (Ictalurus punctatus) have been branded with silver nitrate at this laboratory with mark retentions of over 20 weeks.

A population of green treefrogs (Hyla cinerea) living in an enclosed wet laboratory was used to study the effectiveness of silver nitrate for marking under semi-natural conditions.

Brands were made with the commercial silver nitrate applicators ordinarily used in veterinary cauterization. Each applicator was a wooden stick, 15 cm long by 2 mm thick, and had a tip, about 8 mm long, impregnated with a preparation of 75% silver nitrate and 25% potassium nitrate.

Seven adult treefrogs were branded with different marks. Marking was done with one to three tracings of the applicator on the treefrog's back; the moisture of the skin activated the chemicals. A dark brown mark was formed immediately upon contact (Fig. 1). One animal smeared the mark by struggling, developed a dark color over most of the back, and was found dead 5 days later, possibly of silver nitrate poisoning. Except for brief reactions to the cauterizing chemical, branding had no apparent detrimental effect on the other treefrogs. On three treefrogs, the dark mark had faded into a light mark by 13 days after application. The remaining three were not seen during this period, but later observation revealed that the dark marks had also faded into light marks. This light mark was more difficult to identify than the dark one, but was visible for over 9 weeks.

The ground color of green treefrogs contrasts well with both the initial dark mark and the later light mark. Where long-term marking is needed, this technique should be most useful for dark colored amphibians. The applicator should be moistened before use on dry-skinned amphibians such as toads.

FREEZE-DRYING ANURAN TADPOLES FOR TAXONOMIC EXAMINATIONS

Many taxonomic characters used in the identification of tadpoles concern structures on the oral disc. When preserved in formalin, even species with a small oral disc die with the mouth closed tightly and the oral disc collapsed so that accurate measurements and drawings are difficult. Also, papillae on small specimens are often so translucent that examination is difficult.

Freeze-drying (lyophilizing) (Hower, 1967) corrects the above problems, and it is the only method I have found that gives the desired results. If live tadpoles are placed in the freezer-drier with enough water to cover them and are killed by simultaneous freezing and degassing, they die straight with the mouth open and with the oral disc extended but not distended. After drying, the oral disc and associated structure are opaque white in sharp contrast to the labial teeth. With a sharp blade, the oral disc and jaws can be removed and mounted dry under a coverslip supported by a ring for convenient and accurate observations later.

In fact, the whole body and fin confirmations are maintained satisfactorily and other delicate and translucent structures like the spiracle, vent, and buccal papillae are preserved in natural non-collapsed and easily-preserved positions. The dried specimens are not overly delicate and are easily dissected. If specimens preserved in formalin are rinsed in running water overnight, they will also freeze dry reasonably well, although the various structures stay in their fixed positions.

A METHOD OF OBSERVING MOVEMENTS OF AQUATIC TURTLES

Information accumulated on movements of aquatic turtles has been largely collected by "capture-release" methods (Pearse, 1923; Cagle and Chaney, 1950; Ream and Ream, 1966). Two reported methods of direct observation include goggling (Marchand, 1945) and painting the carapace and observing movements with binoculars from an observation tower.

The aquatic movements of turtles were observed by us by placing a 1/8 inch diameter wooden dowel in the nucal scute (Fig. 1). The hole in the scute was made with a small drill and the dowel was secured with epoxy glue. The length of the dowel depended upon the size of the turtle with a maximum length of 50 cm being used on the largest turtles. Recognition of individuals was accomplished by color coding the distal end of the dowel with paint or plastic tape. When the turtles were in shallow water or were swimming near the surface, their exact location could be plotted by direct observation.

A disadvantage of this method is that the turtle's movement is hindered in heavy vegetation. This was alleviated to some extent by connecting two short dowels with a piece of rubber tubing. This provided greater flexibility while the turtle moved through vegetation and the dowel tended to assume a more horizontal position when the turtle surfaced, thus preventing top heaviness and minimizing wind resistance.

BOOK REVIEW

REASSESSMENT OF MUSCLE HOMOLOGIES AND NOMENCLATURE. By Aselaide Frost Ellsworth. Robert E. Krieger Pub. Co., P.O. Box 542, Huntington, N.Y. 11743. 1974, vi-74, $24.50 (Available from publisher).

Comparative anatomists may note the publication of a new book that deals exclusively with their subject. In a total of 80 pages the author describes and compares the pelvic musculature of the echidna, opossum and tuatara.

Chapter 1 gives a brief introduction and discussion of the evolutionary relationships of stem reptiles and mammals.

After the materials and methods (Chapter 2) and observations (Chapter 3) the next 35 pages describe in detail the musculature, nerves, and skeletal patterns of the subject animals. To illustrate descriptions the author uses detailed line drawings and black and white photographs.

In addition, fifty-two color plates graphically illustrate the dissected skeletal elements and musculature. They are complete with inserted arrows and identification numbers for added clarity. A five page bibliography concludes the text.

Ellsworth's book should be an essential reference if you are interested in the comparative anatomy of primitive mammals and reptiles. If you are not an advanced student of anatomy you will probably realize little for the investment.

A LABORATORY THERMAL GRADIENT

This paper describes the construction of a thermal gradient for studying temperature preferences of small, secretive snakes and lizards. The chamber is a terrarium (92 cm long,27 cm wide, 27 cm deep)insulated on the floor, two sides, and one end with 0.63 cm styrofoam. The substrate is sand 70 mm deep. Heat is provided by a 150 watt thermostat-equipped aquarium heater. One end of a sheet of aluminum foil is wrapped around the heating element. The tip of the heater is buried in the sand to the top of the heating element at the insulated end of the terrarium. The remainder of the foil is doubled into a sheet 145 x 75 mm. The sheet is buried 5 mm below the surface of the sand and extends from the heater to approximately the center of the terrarium. Five masonite cover items (145 x 75 mm) on small wooden blocks were spaced 70 mm apart the length of the terrarium (Fig. 1).

At the opposite end of the terrarium an "S" shaped brass tubing (12 mm diameter) is buried 5 mm below the surface of the sand and used as a cooling element. A seven liter aquarium is placed adjacent to the uninsulated end of the terrarium. An aquarium pump and filter (Dynaflo Motor Filter by Metaframe) is mounted on the side of the aquarium and is used to circulate cold water from the aquarium, through the brass tubing, and back to the aquarium.

The chamber produces a temperature gradient starting approximately 35 mm from the heating element and extending to the cool end of the terrarium. Temperatures around the element are above 100 C. Cover items evenly spaced throughout the length of the terrarium create hiding places along a range of substrate temperatures. One disadvantage is that an aquarium heater used dry only lasts about one month.

Other thermal gradients have proven satisfactory but lacked certain important conditions for studying habits of secretive species. Clark's (1968) method produced a sufficient temperature range but lacked "natural" substrate or cover items. Vance's (1973) gradient had "natural" substrate but lacked cover items. Furthermore, Vance's technique lacked a cooling mechanism and produced a minimum temperature equal only to room temperature (20-24 C).

The thermal gradient described in this paper produced temperatures from 10-45 C, well below and above the preferred body temperatures of most reptiles. By providing semi-natural substrate and cover in such a thermal gradient, one should be able to better estimate preferred body temperatures of small, secretive species.

The following people were helpful in exchange of ideas: Dr. James R. Dixon, Harry W. Greene, Fred S. Hendricks, and Robert A. Thomas.

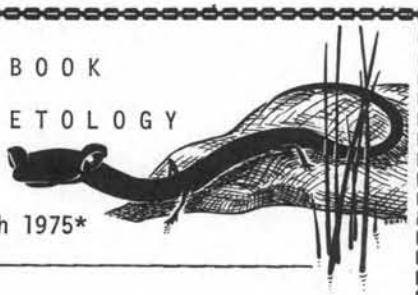
HERPETOLOGY AT TEXAS A&M UNIVERSITY



The Texas Cooperative Wildlife Collection (TCWC), housed in the Department of Wildlife and Fisheries Sciences, presently has in excess of 48000 catalogued reptiles and amphibians with emphasis on South American, Mexican, and Texan forms. The cleared-and-stained and skeletal portions of the collection are expanding and currently contain 368 and 205 entries, respectively. The TCWC houses 25 holotypes and approximately 300 paratypes.

Dr. James R. Dixon, chief curator of the TCWC, is continuing his studies of the herpetofauna of the Iquitos, Peru, region. His prime research interest at present centers around teiid systematics, but he is involved in numerous other studies including the ecology of selected Venezuelan anurans and lizards and systematic studies of several Amazon Basin snakes.

Terry L. Calvin has recently completed an MS degree with an ecological study of the herpetofauna of the Navasota River basin. Steve Cornelius is continuing his investigation on nesting and survival of hatchling sea turtles in Costa Rica. Ben E. Dial is finishing his investigation of the ecosystematics of Coleonyx brevis and C. reticulatus. Fred S. Hendricks has received his PhD degree with an analysis of the systematics of Cnemidophorus tigris east of the continental divide. For the past semester he has served as a lecturer in ichthyology for the department and will remain on the staff in the spring while continuing his studies of the paedogenic Eurycea. Charles M. Mather is initiating a study of niche partitioning between Sceloporus undulatus and S. variabilis in south Texas. Carlos Rivero-Blanco of the Universidad Simon Bolivar in Caracas, Venezuela, will pursue ecological studies of Gonatodes. Mark A. Staton has recently returned from Venezuela where he is working on the ecology of caimans. He will do similar studies on the American alligator in Texas and is presently working up several studies conducted on Venezuelan herps. Robert A. Thomas is revising the genus Philodryas and is involved with problems related to other colubrids of the Bolivian and Peruvian highlands. He completed his MS degree with a study of geographic variation in Elaphe guttata. John A. Wiest, Jr. is revising Chrionius and recently compelted an MS degree with a study of anuran succession to ponds in the Brazos County, Texas, region.

Several student in the Department of Biology are engaged in research which involves herpetozoa. James A. Bennett is working on the effect of polarized light on movement of hatchling sea turtles to the sea. Edmund V. Guidry is studying the parasites of various species of Natrix and W. Lynn Jagers is doing the same with Siren intermedia.

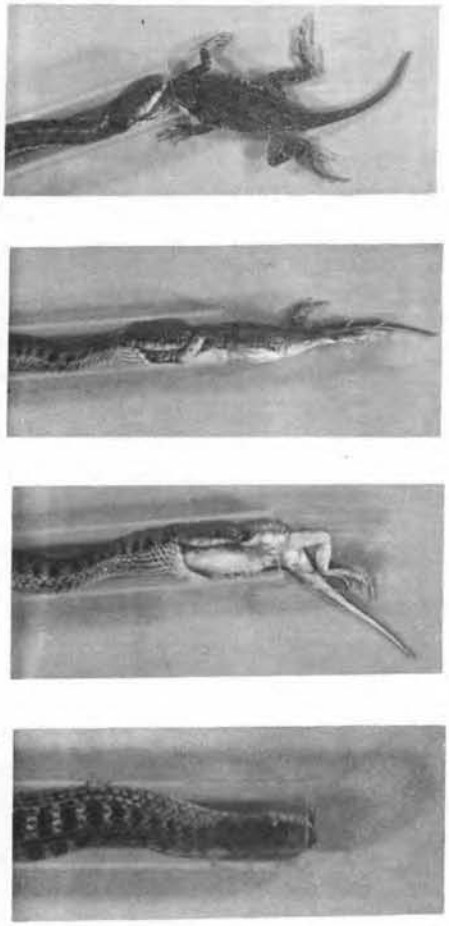
A METHOD FOR FORCE-FEEDING SNAKES



Captive snakes often refuse to feed voluntarily. The following is a method for force-feeding snakes with a minimum chance of injury to the snake or to the handler.

Force the snake being fed, into a plastic or glass tube (making sure that the ends of the tube are smooth) which is 33%-50% the length of the snake. The internal diameter of the tube should be about 1.5 times the diameter of the snake, or slightly wider than the width of the snake's head if it is greater than the body diameter. Once the snake's head has reached the opposite end of the tube, grasp the snake firmly to prevent it from crawling through the tube. It must not be allowed to push its head completely out of the tube.

The food item should have a diameter 0.5-0.65 times that of the snake and should be gently shoved into the snake's mouth and to the back of the throat. If the tube diameter has been well-chosen and the snake has not been allowed to push its head through the tube opening, then it should be able to swallow the food item while in the tube, but be unable to disgorge it. The snake should remain in the tube until swallowing is completed.

The advantages of this method are that (1) a tight grip on the snake's neck is not necessary once it is in the tube; (2) the tube holds the body straight to facilitate swallowing; (3) nothing is forced down the snake's digestive tract for any distance; and (4) risk to the handler is minimized if a venomous species is being fed.

BOOK REVIEW

HUSBANDRY, MEDICINE AND SURGERY IN CAPTIVE REPTILES. By Fredric L. Frye. 140p. VM Publishing, Inc. Bonner Springs, Kansas 60012. 1973. $18.00

Those who maintain live reptiles are sometimes confronted with problems of reptile diseases. Diagnosis and current treatments of reptilian diseases have not been adequately discussed in many of the general accounts of the care of captive reptiles. Generally, such information has been lacking or is beyond the scope of books destined for the use of the general public. A notable exception is SNAKES: THE KEEPER

AND THE KEPT by the late Carl Kauffeld. Nevertheless, I know of no volume comparable to the attractive book by Dr. Frye. It is the first modern significant work devoted to husbandry, medicine, surgery and pathology of all major groups of reptiles excluding the Rhyncocephalia.

Few veterinarians are competent in the treatment of reptile diseases but with the appearance of this book perhaps there is a possibility of greater interest and professional interaction between those who maintain live reptiles and those who may be called upon to treat reptilian diseases. The result should be beneficial to captive reptiles.

The title of this book is clearly indicative of its content: reptile husbandry (34 pages), medicine (63 pages), surgery (24 pages). There is also a brief epilogue, glossary and index. Excellent illustrations of gross pathology, surgical management, and numerous photomicrographs occur throughout the text in an accessible atlas format. The section and illustration on hematology is sure to be consulted by clinical vetinarians and students of reptile medicine.

The section on husbandry contains information on housing, water and humidity, temperature, photoperiod, reproduction, problems associated with nutrition-inanition, avitaminosis, steatitis, fibrous osteodystrophy (frequent in captive iguanas), blepharitis, conjunctivitis and others. The text is concise and the section concludes with a list of 50 references.

The section on medicine contains information on hematology, respiratory infections, infectious stomatitis, abscess, septicemic cutaneous ulcerative disease, trauma, thermal burns, shell defects, shell-plate sloughing, shell fungus, salmonellosis, dysecdysis, fluid replacement therapy, ophthalmic diseases, pseudoneoplasms, parasitism, developmental anomalies, radiology and cardiology. Appropriate treatment is discussed after each disease is presented. Tables list parental antibiotics, miscellaneous drugs, topical ointments, sprays and solutions and parasiticides used in captive reptiles. This information will be of singular interest to herpetologists who may not have convenient information on appropriate drug therapy for captive reptiles. The section concludes with a list of 73 references. In my judgement, this section of the book is a cogent contribution to reptile medicine.

The section on surgery and pathology contains information on anesthesia, presurgical preparation of reptilian patients and much information on surgical procedures. Neoplasia is also discussed. Interestingly neoplasia in reptiles is seldom well documented in the literature but malignant and benign tumors do occur. Lymphocytic leukemia in *Boa contrictor*, osteosarcoma in a monitor lizard and fibrosarcoma in a boa are diagnosed. Pathology was supported in part by a grant from the National Cancer Institute.

This book is specifically written for the practicing veterinarian clinician but it can and should be consulted by anyone concerned with the well-being of captive reptiles. Dr. Frye prefers to see animals in their native habitats and not confined in cages. However, since certain animals are likely to be confined, Dr. Frye states that he must not fail to render what service he can to help preserve such captive creatures in a state of health and (modified) well-being. He wrote this book for that reason. Hopefully a similar volume on amphibians will be forthcoming.

LIFE HISTORY

Thamnophis s. sirtalis. On 24 August 1971 a female garter snake (100.5 cm total length) was collected 3 miles east of Carbondale, Jackson County, Illinois. It was maintained in captivity until 5 September 1971 when it gave birth to 96 normal and 7 deformed and stillborn young (103 total).

The young were measured and ranged from 17-21 cm ($\bar{x}$ = 19.8) total length and 4-6 cm ($\bar{x}$ = 4.6) caudal length. Scutellation agreed closely with the data presented by Smith (1961. Amphibians and Reptiles of Illinois. Ill. Nat. Hist. Surv. Bull. 29(1):233). Infralabials: 9+9 (9%), 9+10 (19%), 10+10 (71%) and 10+11 (1%). Supralabials: 7+7 (99%) and 7+8 (1%). Postoculars: 2+2 (1%), 2+3 (3%), 3+3 (89%), 4+4 (1%) and 3+4 (6%). Preoculars: 1+1 (98%) and 2+2 (2%).

Duberria varigata. On 29 December 1972 a female spotted slug-eater was captured under a decaying log in long grass at Sordwana Bay, Natal, South Africa. The snake had a total length of 373 mm (previous maximum recorded size 325 mm; FitzSimons, V.F.M. 1962. Snakes of Southern Africa, Purnell Ltd, Cape Town). Two days after capture eleven living young were born, two of which died shortly afterwards and were not preserved. The lengths and weights of the remaining nine young were recorded on 3 January 1973, and are shown in Table 1. An unusual aspect of the brood is the wide range of dorsal coloration and marking exhibited by the young, which is much more diverse than that found in adults (FitzSimons, 1962). Five of the young snakes accepted small slugs readily, and survived in captivity for over 150 days. It was noted that olfactory rather than visual clues appeared to be more important in the recognition of food, and snakes were frequently observed to follow the slime trails of slugs that were out of sight. After feeding adherent slime was wiped from the head against rocks, grass, etc. Growth was roughly linear, and 150 days after birth the young snakes measured 114-126 mm ($\bar{x}$ = 119 mm) in length, and weighed 2.02-2.40 gms ($\bar{x}$ = 2.13 gms). Sloughing occurred at approximately 44 day intervals (range 30-55 days). The mother (TM 42949) and seven of the young (TM 42955-7, 45588-91) are now in the Transvaal Museum, Pretoria, collection.

CLIFFORD HILLHOUSE POPE
1899-1974

It is difficult to decide whether Clifford Pope should be described as a writer or as a herpetologist. Actually he was both. He is perhaps more aptly characterized as a writer-herpetologist whose books did far more than any of their predecessors to arouse an intelligent interest in reptiles of the United States. His first publication, an article written for Natural History magazine, appeared in 1924, three years after he had begun his field work in China. Half a century later, after he had written eight books and nearly one hundred articles, Clifford died of a stroke on June 3, 1974.

Like a good many other naturalists of his generation, Pope was born in a small town, in his case Washington, Georgia. He was undoubtedly familiar with many of the vertebrates in the area before he entered the University of Georgia at the age of 17. Two years later, however, he left Georgia to continue his studies at the University of Virginia where he obtained his B.S. in 1921. That same year Roy Chapman Andrews, who had been instrumental in raising the funds that permitted The American Museum of Natural History to support another elaborate expedition to Asia, was looking for an assistant. Clifford applied for the position and was soon enroute to China. As leader of the Central Asiatic Expeditions, Andrews originally planned to have Pope act as a general assistant. But as Clifford observed later, "it soon became evident that there was nothing to hinder my working alone and independently as a collector of reptiles, amphibians, fishes and mammals. With a special fondness for reptiles, and an ever increasing interest in amphibians, I naturally spent most of my time and energy in the field of herpetology."

Other members of the expedition were also collecting amphibians and reptiles that were being sent back to the museum. Until Pope returned from China in 1926 these collections were being studied by Karl P. Schmidt, who had described new species in preliminary accounts, and summarized the results of the expedition in three faunal reports. Karl Schmidt's reports covered approximately half of the herpetological material eventually obtained from China, and Pope carefully noted that Schmidt's "thorough and conscientious beginnings" paved the way for the additional preliminary accounts that Clifford published after completing his field work. These preliminary studies, first by Schmidt and then by Pope, continued for more than a decade before Pope's comprehensive and well-planned volume, THE REPTILES OF CHINA appeared.

Whereas the first of Pope's articles to appear in print dealt with Hainan Island, an account of the breeding habits of two genera of plethodontid salamanders in North Carolina appeared shortly afterward. Pope had been interested in the salamander fauna of the southern Appalachians before he had gone to China. The year after he returned he wrote two popular articles that dealt with his experiences in China. That

same year the museum published the first, and also the last, ichthyological paper that Clifford ever wrote, a fairly extensive account of the fishes of Hainan. Even though this report on fishes was carefully prepared, it seems probable that Clifford regarded it as something of a chore, particularly when he was anxious to complete his studies of the amphibians and reptiles in the collections. Even while continuing his investigations and issuing reports in preparation for the volume that was to cover every reptile ever reported from China, Clifford sporadically found time to write articles for the general reader. Whether writing for scientific or 'popular' journals, however, Clifford took pride in keeping his technical jargon to the minimum. Anything he ever wrote was both readable and comprehensible.

Despite ample proof of his talents as a herpetological investigator, Pope resumed his studies at the American Museum as 'assistant' in the department of herpetology in 1926. He was finally promoted to the rank of assistant curator in 1928, and he had every reason to believe that he had a 'permanent' position at the museum. Meanwhile, Clifford had the great good fortune to meet Sarah Haydock Davis, who had been assisting G. Kingsley Noble in his experimental studies of salamanders. Clifford and Sarah soon discovered that they shared a great deal more than their interests in herpetology and they were married in 1929. "Sally", as Sarah was affectionately known to her friends, was soon helping with the work entailed in examining specimens, tabulating data, indexing the literature, and all the other drudgery that does into the preparation of a huge scientific report. She and Clifford collaborated on a study of the green pit-vipers of southeastern Asia, and they were co-authors of the report that appeared in 1933. Despite her invaluable assistance, invariably acknowledged by Clifford, Sally's name rarely again appeared as a co-author. This must have worried Clifford, for when his book, REPTILES ROUND THE WORLD, appeared in 1957 he felt impelled to explain that Sally had spent nearly as much time helping him as he had spent writing the book. Almost plaintively he added, "Her name is not with mine on the title page merely because she steadfastly refused to have it there."

Clifford had become well known as the author of several excellent books and pamphlets (the latter written for the New York Zoological Society) by the time he wrote that statement. Sally had been helping him for more than a quarter of a century. Nevertheless, they had gone through some lean years. The stock market had crashed the year of their marriage, but as a member of the scientific staff of a large, well established museum, Clifford may have felt secure. The economic situation deteriorated rapidly in the ensuing years, however, as thousands of banks failed in 1932 and 1933, and one worker out of every four was unable to find employment. Clifford was happily struggling to complete the manuscript for THE REPTILES OF CHINA when Franklin Roosevelt was inaugurated as President. Roosevelt's efforts to alleviate the unemployment situation by setting up the Works Progress Administration enabled Clifford to obtain assistance in his work. Museums, perennially understaffed, suddenly found themselves hard pressed to supervise the hordes of trained (and untrained!) individuals, technicians as well as secretaries, artists and scientists, that the federal government assigned to public institutions. Thanks in part to the help provided by the W.P.A., Pope managed to complete the text and assemble all the illustrations for THE REPTILES OF CHINA in 1934 and the volume appeared the following year.

This important contribution to our knowledge of the fauna of China established Pope as something more than a promising young herpetologist. Members of the American Society of Ichthyologists and Herpetologists expressed their esteem for Clifford Pope by electing him president of the organization in 1935. Unfortunately this year proved to be memorable for the

Popes for other reasons as well. For even though Clifford had achieved recognition in his field, he lost his position as assistant curator. Completion of his magnum opus had demanded that Clifford devote his efforts to the task. In doing so, however, Pope aroused the ire of G.K. Noble, who had become chairman of the Department of Herpetology in 1924. So it was that Clifford Pope, at the age of 36, in the throes of the Great Depression with a wife and three young sons to support, found himself without a job.

Where others facing adversity at the time were turning to the W.P.A. to solve such problems, Clifford paused to consider the situation as well as his talents and promptly adopted the course that seemed preferable to him. Writing for such magazines as Boy's Life, Natural History, and Asia, had whetted his desire to improve his literary style, and while carrying out his investigations of Chinese reptiles he had acquired a formidable knowledge of the herpetological literature. The technical literature was voluminous, but the few books on reptiles written for the amateur were mainly those of Raymond L. Ditmars, which offered little more than brief descriptions of the morphology and habits of individual species. Why not write something more like Noble's BIOLOGY OF THE AMPHIBIA, but without the technical jargon, and restricted to one group of reptiles? Clifford soon drafted an outline, and promptly set out to write the book that was still selling three decades later as SNAKES ALIVE AND HOW THEY LIVE. Even though herpetologists and specialists in other fields have greatly enhanced our knowledge of snakes since Pope's book appeared in 1937, it summarized much of what was known at the time. There is no satisfactory way of evaluating the impact of a book of the sort, but an authoritative, readable summary of a vast, scattered literature dealing with any topic almost inevitably opens the door to further investigation. And, Pope's book was not read exclusively by amateurs; the title continues to turn up in the bibliographies of books and articles written by experts.

Incredible as it seems in view of today's prices, Pope's well illustrated account of the snakes, the most authoritative book of its kind available in 1937, was sold at the bargain price of $2.50. Relatively few students could afford to buy such books during the depression years, but there was sufficient demand for Pope's book to induce the publisher to keep SNAKES ALIVE in print, and sales increased at a rapid rate as economic conditions improved. The scientific staffs at most museums were at minimum levels until after World War II, however, and few herpetologists could find positions in universities. If royalties from books failed to provide a handsome income for authors, the few assistant professors and assistant curators who could find jobs began at salaries ranging from $1,800 to $2,500. Even before the meager royalties began to arrive, Pope was busily combing the literature and preparing the text for THE TURTLES OF THE UNITED STATES AND CANADA.

Until this book appeared in print in 1939, no complete account of the American turtles north of Mexico existed. As more reliable sources of information became available, partly because authors with the requisite background were writing pamphlets and articles for zoos and museums, the demand for authoritative books dealing with amphibians and reptiles increased. At least three publishers began issuing handbooks, although Pope's book on turtles had been in print for more than a decade before Archie Carr's HANDBOOK OF TURTLES appeared. Each new book seemed to arouse more interest in herpetology, for the demand for Pope's books sometimes increased several years after they were published. Clifford was encouraged to continue his writing, but his next book, CHINA'S ANIMAL FRONTIER published in 1940, drew heavily on his experience as a collector in China.

Clifford's interest in the fauna of the country where he had begun his professional career never waned. He regretted having to abandon plans to include the amphibians in his reports of the Central Asiatic Expeditions, but he

remedied this omission to some extent by collaborating with a member of the staff at Yenching University in Peking, Alice M. Boring. Their resume of what was known of Chinese amphibians was published in Peking the year before Pope joined the staff of the Field Museum of Natural History as curator of the division of amphibians and reptiles in 1941.

This post had been vacated by Karl P. Schmidt, when he became the museum's curator of zoology. Karl had been a firm supporter of Clifford since the days when they were both at the American Museum of Natural History, and he was outraged when Clifford lost his job at this museum. Karl had impatiently awaited the opportunity to offer Pope a position in Chicago. The Popes moved to Winnetka, and Clifford enthusiastically resumed his research, at the same time writing non-technical articles for publications such as Field Museum News. Museums, eager to enlist the interest and support of the public, were no longer restricting their activities to exhibits and research. They were issuing their own publications addressed to the public and they demanded that curators write something besides their technical reports. Few curators were quite so well prepared as Clifford, whose informative, rather exhaustive booklet, AMPHIBIANS AND REPTILES OF THE CHICAGO AREA, was published in 1944.

Immediately following his arrival at the Field Museum Pope' s investigations dealt mostly with snakes. He carried out experiments designed to ascertain what might be the most effective means of treating bites from rattlesnakes, and later (with A.A. Zimmerman) he investigated the phenomena involved in the growth and development of the snake's rattle. Transportation had been a problem during the war years, and few herpetologists found it feasible to carry out much field work until a year or so after the war ended. When suitable vehicles became available there was a resurgence of Clifford's interest in salamanders. By now his three sons were old enough to help with field work, and the Pope family became a formidable team of collectors.

Clifford had been in his early forties when he accepted the position at Field Museum, which meant that he would reach retirement age before he had been employed by the museum long enough to be entitled to a normal pension. Anticipating that he could more profitably augment his income by preparing additional books, in 1953 Clifford resigned from the museum's staff to devote his efforts to writing.

During the 12 years that Pope served as curator he prepared nearly a score of articles for scientific journals, and he wrote chapters for two more or less technical books. In addition to preparing two sizeable pamphlets for the New York Zoological Society, Pope wrote a good many encyclopedia articles, and he was a frequent contributor to the publications the museum distributed to the public. Clifford never ceased worrying about the clarity of his writing, and he devoted considerable thought and effort to improving his style. He may have spent the better part of a year writing THE REPTILE WORLD, A NATURAL HISTORY OF THE SNAKES, LIZARDS, TURTLES, AND CROCODILIANS, which appeared in 1955, roughly two years after he had resigned his curatorship. Another two years had elapsed before REPTILES ROUND THE WORLD appeared as "A simplified natural history of the snakes, lizards and turtles," addressed to the tyro. These two books, as well as THE GIANT SNAKES, issued in 1961, were all published by Alfred A. Knopf. The year following their publication in the United States, these three books appeared in British editions published by the London-based firm of Routledge and Keegan Paul.

Even while working on his books, Pope usually wrote three or four articles a year, including biographical notes, and even articles dealing with raccoons and "the natural superiority of

pigs." Clifford was still living in Winnetka in 1957, when his good friend Karl P. Schmidt was bitten by a boomslang on the afternoon of September 25th. Karl carefully wrote down his symptoms during the ensuing hours until the following morning, but by noon on the 26th far more serious symptoms appeared that led to Karl's death three hours later. Karl's notes were incorporated in an account "Fatal bite of captive African rearfanged snake (Dispholidus)" that Pope wrote for Copeia, where it appeared in number 4 of 1958. Clifford served as the staff consultant on definitions of reptiles and amphibians for the Random House Dictionary of the English Language in 1966, and he occasionally wrote for encyclopedias after that. But by the early 1970's Pope's energy began to wane. By 1973 he must have realized that he lacked the strength to make much more use of his extensive library of books and reprints, which he sold to a museum in Los Angeles.

Few herpetologists ever had a better over-all grasp of the herpetological literature. Pope spent a fair percentage of his time going through bibliographies and indexes to the literature, and even more time reading and digesting what he found. His work in the field and laboratory revealed new species that he described, but he devoted more effort to writing readable summaries of what others had discovered than he spent on his own research. His niche in the field of herpetology is perhaps more aptly described as that of the synthesizer, even though he was a capable investigator. Beyond that Pope was an exceptional human being, with an intense interest in his fellow man. Where others would have been enraged at the stupidities and dishonesty of politicians or businessmen, Clifford more often viewed their acts with amusement, as human foibles or manifestations of human frailty.

Kathlyn Russell, who wrote a column for the newspaper in Escondido, California, where Clifford spent about a decade before he died, quite properly describes Clifford Pope as having been "affable, kind and soft-spoken", and those who knew Clifford will heartily agree with Mrs. Russell that "It was a pleasure and a privilege to have known Cliff---". During nearly four decades that I knew Clifford, I cannot recall ever having met anyone whom he might have considered an enemy. The world will surely be less without Clifford H. Pope.

CARL FREDERICK KAUFFELD

April 17, 1911 - July 10, 1974

Carl Kauffeld was one of those fortunate persons whose hobby was also his source of livelihood. His acquisition as a youth of Ditmars' "Reptile Book" stimulated his interest, as it did in the cases of so many of us of the same generation, and herpetology became his lifelong vocation and avocation.

Kauffeld was born in Philadelphia to parents of German descent, and he attended the public schools in that city. During his high school years he haunted the Academy of Natural Sciences, where he worked for a time as a volunteer in the department of entomology. He was also a very frequent visitor to the Philadelphia Zoo, where he soon became the friend of Robert Hess, also of German ancestry and who served as the reptile house keeper for 42 years. Young Carl was permitted to go behind the scenes and even to assist in the care of the collection, experiences which helped prepare him for his later long career in the husbandry of captive reptiles and amphibians. Kauffeld's interest in the Philadelphia Zoo remained so keen that he seldom failed to pay us a visit in later years when he made periodic excursions from New York to visit his parents.

When he was old enough to travel by himself he took public transportation from Philadelphia to the Pine Barrens in New Jersey, which in those days, even at their closest approach to the big city, were uncluttered by housing, shopping, and retirement developments. There he would hike all day, enjoying the solitude of the area and catching what he could.

Kauffeld's first professional employment in herpetology was as an assistant in the Department of Herpetology of the American Museum of Natural History in New York, where he served from 1930 until 1936. His escape from the brilliant, autocratic, and always suspicious Gladwyn Kingsley Noble, then head of the Department, came suddenly, and Kauffeld found himself in possession of a dream job - Curator of Reptiles in the brand-new Staten Island Zoo. That institution, the smallest of the five zoos eventually completed, one in each of New York City's five boroughs, was housed in a single building approximately half of the exhibition space of which was devoted to reptiles whereas the other half was divided among the mammals, birds, and fishes. Kuaffeld not only looked after the collection but he helped to plan and assemble it. The long series of longevity records he achieved, especially for snakes and many of which are still unchallenged, attest to his ability as a caretaker, which is all the more noteworthy in view of the fact that our knowledge of reptilian diseases and their treatment was in its infancy throughout most of his career. He developed an extraordinary interest in rattlesnakes and eventually was able to

Carl Frederick Kauffeld

exhibit living specimens concurrently of all the taxa of the genera Crotalus and Sistrurus indigenous to the United States.

Kauffeld's influence on young people interested in herpetology was enormous. First there were the men who served at one time or another as reptile keepers under his direction. Many of them have gone on to higher positions in the zoo, medical, or biological fields. Among them are John E. Werler, now Director of the Houston Zoo and formerly Curator of Reptiles of the San Antonio Zoo; David Zucconi, Director of the Tulsa Zoo; Louis Pistoia, Curator of Reptiles of the Columbus (Ohio) Zoo; Charles Hackenbrock, Professor of Anatomy at Johns Hopkins University; and Robert F. Mathewson, who was for many years Director of the Lermer Laboratories of the American Museum of Natural History on Bimini, the Bahama Islands. Many of the current staff members at the Staten Island Zoo also received their early training under Kauffeld, including James McNeish, Superintendent; William H. Summerville, General Curator; and Keepers Carl Alimonti, Robert Zappalorti, and Zigmund Leszczynski.

The Staten Island Herpetological Society, sponsored and guided by Kauffeld for a great many years, served as a stimulus for countless young people many of whom, under his influence, had their interest crystallized in the study of reptiles and amphibians. They include William G. Degenhardt, of the University of New Mexico; Carl Gans, of the University of Michigan; and Richard Highton, of the University of Maryland.

Field work was almost a passion with Carl Kauffeld, and he escaped from the growing and festering megalopolis of New York at every opportunity. He never lost interest in the New Jersey Pine Barrens, and he assembled masses of notes and records on the area that he graciously turned over to me for inclusion in my own review of the herpetology of the region in which I am once again actively engaged. Because of his great interest in rattlesnakes and his love of the area, Kauffeld made many field trips to the Southwestern United States, and in 1940 he undertood a relatively long collecting trip to northeastern Mexico and south to Mexico City.

Although he made several technical contributions to herpetological literature, most of Kauffeld's writing was in a popular vein and aimed toward the amateur and the public in general. He was a regular contributor to the News Bulletin of the Staten Island Zoological Society (later renamed "In Animaland") and to various amateur herpetological society newsletters. He authored three books, the first of which, published in 1937 and entitled "Snakes and their Ways", was with C. H. Curran, then Associate Curator in the Department of Entomology at the American Museum of Natural History. Kauffeld's two later books, "Snakes and Snake Hunting" (1957) and "Snakes: the Keeper and the Kept" (1969) had a profound influence on a small army of collectors and market hunters for the pet trade. Lured by his detailed descriptions of good collecting sites, scattered geographically from the Pine Barrens to the lowlands of South Carolina and the canyons of the Huachuca Mountains of Arizona, they descended on them, often in large numbers, and literally tore their surfaces to pieces in their eagerness to find specimens similar to those Kauffeld had obtained in earlier years. His pinpointing of choice localities earned him the scathing criticism of many conservationists, but inadvertently he may have done the herpetological fauna a favor by concentrating the depredations in a few places while equally productive nearby areas were spared from the pet and market hunters.

Kauffeld served in the Army Medical Corps during World War II. In 1963 he became Director of the Staten Island Zoo, a post he held until his retirement in 1973, after 37 years with that institution.

"LETTER TO THE EDITOR"

Dear Sir:

A disturbing irony appeared in the most recent mailing from the SSAR. Two items shared the same envelope. Herpetological Review contained a report of a meeting that discussed the effects of conservation laws on herpetological research, and concluded with a statement emphasizing the need "to fully utilize any animal taken from the wild for research and public education purposes" (vol. 5, p. 42). The second item, the Journal of Herpetology, included a paper that reported the capture of 14,282 sea snakes in the Gulf of Thailand (vol. 8, pp. 201-210).

The stated goal of the research, which was supported in part by the Office of Naval Research, was collection of data concerning "the relative abundance of each species" and "The amount and toxicity of venoms obtained from each sea snake . . ." It seems improbable that all 14,282 snakes were fully utilized, especially considering that they were obtained in only three trips. If venom was really collected from all the snakes, it should supply the world's entire research needs for the foreseeable future.

The paper contained no clear statement of what happened to the snakes -- whether all were killed or some released alive, whether venom was extracted from every individual, whether the snakes were placed in a museum collection after venom was collected, or whether there were reasons for collecting so many snakes. The author of the paper did not reply to my letter to him raising these questions.

The SSAR, according to its Constitution, intends "To encourage conservation of wildlife in general and amphibians and reptiles in particular." Achieving this laudable goal will require some efforts that we are apparently not presently making. I suggest that it should be the Society's policy that the ecological impact of research be considered both when a project is planned and when a manuscript is submitted for publication. While it is not possible to draw a priori guidelines of what is and is not permissible to apply to all experiments or all experimental animals, it is possible, a posteriori, to identify work that has exceeded the bounds of what is reasonable and necessary.

Secondly, many biologists are conscientious in designing their research to make full use of the experimental animals and to minimize ecological impact. I think that these people deserve credit for their efforts -- a brief sentence in a paper noting the ultimate disposition of the experimental animals would help to accomplish that.

Although it is foreign to the ivory tower to allow such considerations as public opinion to influence our pure research, we must realize that the public attention we are trying to focus on the plight of endangered species will fall on our own experiments as well. If we do not practice what we preach, we risk losing the confidence of both the public and legislators, and dooming our conservation efforts to defeat.

F. Harvey Pough

10-18-74

MORE ABOUT THE SSAR-HL AUBURN UNIVERSITY MEETINGS (11-14 AUGUST 1974)

The Auburn University meetings were among the most pleasant ever held. Drs. Robert H. Mount and Geroge W. Folkerts served as co-chairmen. They treated those attending to some real hospitality and well organized meetings.

The SSAR Board met on the afternoon and evening of 11 August.

1) Potentially new publications or publication series were discussed and these included a translation series and a checklist for North American amphibians and reptiles.

2) The Board approved issuing 15 Catalogue accounts for six dollars. No time period is being stipulated for their issuance.

3) The meeting site for 1975 was approved and is California State University, Fullerton, California. The meeting Chairman is Dr. William Presch and the dates are 11-14 August.

4) Miami University of Ohio was considered as the 1976 meeting site.

5) Harry Greene, University of Tennessee, Knoxville won the SSAR Student Prize for his paper, "Defensive tail display by snakes and amphisbaenians. J. of Herpetology 7(3): 143-161.

6) SSAR membership (25 July 1974) included 1,202 individual & institutional members (63 life, 783 U.S., 104 foreign and 252 institutional).

7) SSAR provided $140 for the preservation of the Monte Verde Cloud Forest in Costa Rica, Central America.

8) A budget of $23,100 was adopted for 1975.

9) SSAR membership dues for 1975 are: $8 students, $10 regular members, $15 sustaining and $20 contributing.

10) The Nominating Committee announced the slate of candidates:

For Chairman-elect
James L. Vial
W. Ronald Heyer

For Director
John Wright
James Murphy

For Secretary
J. W. Edward Wortham
Stephen R. Edwards

For Treasurer
Henri Seibert

Other highlights of the Auburn meeting included:

1) a well attended symposium on "the long-term effects of ecosystem alterations on amphibian & reptile populations,"

2) a social which featured some impromptu swimming.

3) an excellent and well cared for live animal exhibit,

4) great food and conservation at the catfish fry in Chewacla State Park,

5) field trips to the Red Hills & Cheaha Mountains.

We extend a hearty "well done" to Drs.Folkerts, Mount, the Local Committee and all those wonderful Auburnites who worked so diligently to make these meetings a great success.

SSAR COMMITTEE ASSIGNMENTS - 1975

Local Committee 1975 Meeting
SSAR-HL Annual Meeting will be held at California State University, Fullerton, Calif., August, 1975.

SSAR THANKS YOU!

Once again it is our pleasure to acknowledge those individuals who have helped the SSAR by becoming contributing or sustaining members. For the year 1974 we had 47 contributing members and 137 sustaining members. This response, which netted $613, was enough to cover the costs of our embryonic Circular program.

Henri C. Seibert

"SHARE AND LEARN" SYMPOSIUM IS SUCCESS

On the third weekend in July, herpetologists from four states attended a series of meetings in Louisville, Kentucky, sponsored by the Kentucky Herpetological Society. A total of over fifty individuals were involved in the two days of activities. The topic of the conference was "Share and Learn", and was aimed at encouraging herpetologists to join in dialogue for mutual benefit.

The first meeting was held on Saturday, July 20 at the University of Louisville. Tom Collins of the University of Kansas and Burt Monroe of the University of Louisville shared some of the current problems in the herpetology of Kentucky and encouraged work in several areas. Mike Douglas, University of Louisville, and John MacGregor, University of Kentucky, both presented slide presentations on some of the work which they have recently done in the state. This was followed by a tour of University of Louisville's collection of living and preserved specimens.

Sunday's (July 21) activities began with a field trip to a woodland pond in Bernheim Forest, south of Louisville. This very active pond has been the subject of intense study by Mike Douglas, who guided us through some of his research procedures.

The climax of the weekend was the regular monthly meeting of the Kentucky Herpetological Society. The keynote speaker, Dr. Sherman A. Minton, Jr., assisted by his wife, Madge, gave an excellent presentation on the surprising, if not unassisted mobility of many species of the world's herpetofauna.

This two day symposium gave everyone involved a chance to acquaint themselves with some of the work being done and need for additional research in Kentucky herpetology. In addition, it gave all a chance to get acquainted with each other, colleagues in a common task. The group departed with a pledge to continue such get-togethers.

William W. Milstead, 46; Professor of Biology, University of Missouri - Kansas City, died 29 November, succumbing to the effects of a lifetime of diabetes. Author of more than 40 articles and books, he is best known for his contributions to evolution in box turtles (Terrapene) and lizard ecology. He was a life member of the A.S.I.H. Board of Governors, 1961-1966), H.L. (Executive Council, 1966-1969) and S.S.A.R. (Board of Directors, 1970-1973).

ANNOUNCEMENT

PRACTICAL HUSBANDRY, MEDICINE, AND SURGERY OF CAPTIVE REPTILES

A 2-day intensive course for veterinarians, personnel in research and educational institutions, herpetologists, zoological garden keepers, and sophisticated amateurs concerned with health care of reptiles is being offered 8-9 March 1975 at the American Museum of Natural History, Central Park West at 79th Street, New York City.

Lecture and discussion topics include husbandry, medicine, pathology, and surgery. The instructor, Fredric L. Frye, D.V.M., is noted specialist in veterinary care of reptiles. His book "Husbandry, Medicine and Surgery of Captive Reptiles" will be available to course participants at a reduced price.

Pre-enrollment is advised to assure participation. The course fee is $60, but a reduced fee of $50 will be available to members of the Herpetologists' League and/or of the Amer. Soc. of Ichthyologists and Herpetologists.

BULLFROG EATING A BIRD

The Bullfrog, *Rana catesbeiana*, is a well-known frog with a voracious appetite, always ready to eat whatever it can get. The following observations were made between Corvallis and Albany, Benton County, Oregon. A movement in shallow water along the margin of a small pond was noticed. Investigation showed a solitary bullfrog about two feet from the sandy shore with the posterior half of a bird hanging from its mouth. The bullfrog was in floating and emergent aquatic vegetation and did not move as photographs were taken. The total length of the bird was approximately equal to the snout-vent length of the bullfrog. No apparent difficulty in swallowing the bird was noted. Attempts to capture the bullfrog resulted in its retreat to deeper water with neither bullfrog nor bird being collected. Dr. George M. Sutton, University of Oklahoma, identified the bird as probably a juvenile Red-winged Blackbird.

A Xanthic *Chrysemys scripta elegans*

Albinism (Cagle, 1947; Hensley, 1959) and melanism (Viosca, 1933; Carr, 1952; McCoy, 1968) have been described from the turtle *Chrysemys scripta*. Xanthism has not been previously reported from this species. A xanthic juvenile *Chrysemys scripta elegans* (49 mm carapace length) was collected 15 June 1973 at the Darrell Saul Minnow Farm, 3 mi. E. Des Arc, Prairie County, Arkansas and given to Griffin (Fig. 1). Kodachromes of the turtle were sent to Ernst for identification. The turtle is alive and in the possession of Griffin.

Instead of the typical green to olive, the ground color of the carapace is bright yellow, especially the cervical, marginals, and pleurals. The amount of yellow pigment is less on the vertebrals, but is still greater than usual. The carapacial pattern is reversed from normal with light green markings bordered by dark green on a yellow background instead of yellow markings on a darker background. The plastron and bridge coloration and pattern are normal.

The head pattern is atypical as the red postorbital stripes are enlarged and spread dorso-medially with the left fusing posteriorly with a broadened, red, prefrontal arrow. The postorbital stripes widen posteriorly and extend well onto the neck where they are separated dorsally by a narrow, green bordered, yellow stripe. Anteriorly the postorbital stripes move dorsally over the eyes. There is also a large red spot behind and above the right eye. The pigmentation of the eye, underside of the chin and neck and limbs is normal.

Fig. 1. Xanthic Chrysemys scripta elegans from Prairie County, Arkansas.

Husbandry, Medicine & Surgery in CAPTIVE REPTILES

by Fredric L. Frye, D.V.M.

The only book of its kind!

A *must* for anyone concerned with the care of reptiles. Hundreds of definitive color photographs and photomicrographs provide a practical guide to the care, diagnosis and treatment of a variety of reptiles.

- **240 full-color illustrations**
- **dosage tables**
- **radiographs**
- **ECG tracings**
- **extensive references**

CAUDATA

EURYCEA LUCIFUGA (Cave salamander). U.S.A., Indiana, Vanderburgh Co., 2 mi W Evansville; 13 June 74; Lodato, Winternheimer, Prectel and Flittner. M. J. Lodato. Univ. Michigan Mus. Zoo., UMMZ 133295-6. First record for county; indicates occurrence of relict population in the hiatus between uplands in south central Indiana and extreme southern Illinois. Submitted by MICHAEL J. LODATO, Middle Mississippi Valley Herpetologists, 925 Park Plaza Dr., Evansville, In 47715.

SALIENTIA

BUFO OLIVACEOUS (Baluchistan coastal toad). IRAN, Strait of Hormoz, Hormoz Island; 25 March 1974; R. G. Tuck. R. Khaza'ie and R. G. Tuck. Muze-ye Melli-ye Tarikh-e Tabi'i, MMTT 499500. First record of amphibian for island. Submitted by ROBERT G. TUCK, Jr., Muze-ye Melli-ye Tarikh-e Tabi'i, Department of the Environment, P.O. Box 1430, Teheran, IRAN.

BUFO SURDUS LURISTANICUS (Lorestan toad). IRAN, Khuzistan Province, 6 kilometers W Pol-e Jeh Jeh; 21-22 March 1974; D. M. Lay. R. Khaza'ie and R. G. Tuck. Muz . Mel. Tar. Tab., MMTT 218-220. Third known locality, others being the type locality in Lorestan Province and Masjed-e Suleiman in Khuzistan (Eiselt, J., Ann. Naturhistor. Mus. Wien, (1973) 77: 181-243). Submitted by ROBERT G. TUCK, Jr.

GASTROPHRYNE CAROLINENSIS (Eastern narrow-mouthed toad). U.S.A., North Carolina, Guilford Co., 5 mi N Greensboro, Guilford Courthouse National Military Park; 7 August 1974; K. L. Becker, H. T. Hendrickson and J. E. Wiley. W. Palmer. North Carolina State Mus. Nat. Hist. NCSM 14082. First record for county, extends North Carolina range into the northern Piedmont. Submitted by H. T. HENDRICKSON, Department of Biology, University of North Carolina at Greensboro, Greensboro. NC 27412

HYLA SQUIRELLA (Squirrel treefrog). U.S.A., North Carolina, Guilford Co., 5 mi N Greensboro, Guilford Courthouse National Military Park, 7 August 1974; K. L. Becker, H. T. Hendrickson and J. E. Wiley. W. Palmer. North Carolina State Mus. Nat. Hist., NCSM 14083. First record for county, extends North Carolina range at least 80 mi W of the Fall Line into the central Piedmont. Submitted by H. T. HENDRICKSON.

RANA MACROCNEMIS PSEUDODALMATINA (Iranian long-legged wood frog). IRAN, Gilan Province, between Asalem and Khal-Khal (Heroabad); 10 May 1974; R. Khaza'le, M. Thireau, K. Kimball and R. G. Tuck. R. Khaza'ie and R. G. Tuck. Muz. Mel. Tar. Tab., NMTT 44951. Previously known from five specimens from type locality in Mazandaran Province. Submitted by ROBERT G. TUCK, Jr.

SAURIA

COLEONYX VARIEGATUS (Banded gecko). MEXICO, Gulf of California, Baja California del Sur, Isla Coronados, SW end, 27° 07' N 111° 17' W; 25 May 1970; S. C. Williams, V. F. Lee. R. W. Murphy. California Acad. Sci., CAS 127459. The juvenile gecko appears similar to C. v. slevini in all respects except in having four instead of three gular scales in contact with the first infralabials; first record for this island. Submitted by ROBERT W. MURPHY, Department of Herpetology, California Academy of Sciences, Golden Gate Park, San Francisco, CA 94118.

CYRTODACTYLUS SCABER (Keeled rock gecko) IRAN, Strait of Hormoz, Hormoz Island; 31 March 1974; A. Ahmadi. R. Khaza'ie and R. G. Tuck. Muz. Mel. Tar. Tab., MMTT 228-229. First record of any lizard for Hormoz Island. Submitted by ROBERT G. TUCK, Jr.

LACERTA TRILINEATA MEDIA (Median three-lined lizard). IRAN, Loristan Province; Oshtrankuh Protected Region, Dare Asbar; 13 May 1974; R. Khaza'ie, M. Thireau and R. G. Tuck. R. Khaza'ie and R. G. Tuck.

Muz. Mel. Tar. Tab., MMTT 458-459. First record for Loristan Province. Submitted by ROBERT G. TUCK, Jr.

PHRYNOSOMA MODESTUM (Round-tailed horned lizard). U.S.A., Texas, Zapata Co., H. B. Zachry Randado Ranch, 26 mi NE Zapata; 25 October 1970, 19 July and 25 September 1971; J. H. Everitt and I. Higginbotham. A. H. Chancy. Texas A and I Univ. collection, TAIC 2238, 2671, 2679. The first known record for southern Texas extends the range southward approximately 175 miles from Kinney Co. record (Raun and Gehlbach, Dallas Mus. Nat. Hist. Bull. (1972)2). Submitted by JAMES H. EVERITT, USDA, Agricultural Research Service, P. O. Box 267, Weslaco, TX 78596.

SCELOPORUS UNDULATUS CONSOBRINUS (Southern prairie lizard). U.S.A., Arizona, Pima Co., 10.6 Km SSE Arivaca; 19 March 1972; S. F. Hale. S. F. Hale. Univ. Arizona, Dept. Zool., UAZ 37828. First record west of Santa Cruz River basin in southern Arizona extends range westward approximately 90 mi. Submitted by STEPHEN F. HALE, 1449 E Tenth St., Tucson, AZ 85719.

SERPENTES

COLUBER RHODORHACHIS (Cliff racer). IRAN, Strait of Hormoz, Hormoz Island; 25 March 1974; R. G. Tuck. R. Khaza'ie and R. G. Tuck. Muz. Mel. Tar. Tab., MMTT 516. First colubrid record for Hormoz Island. Submitted by ROBERT G. TUCK, Jr.

ECHIS CARINATUS (Saw-scaled viper). IRAN, Strait of Hormoz, Hormoz Island; 23 September 1973; M. T. Farvar, R. B. Nehring. R. G. Tuck. Muz. Mel. Tar. Tab., MMTT 118. First viperid record for Hormoz Island. Submitted by ROBERT G. TUCK, Jr.

LYTORHYNCHUS RIDGEWAYI (Afghan owl-headed snake). IRAN, Semnan Governorate, Dasht-e Tal, ca. 30 Km SSE Shahrud; 25 April 1974; R. Khaza'ie, M. Thireau, J. Nouri and R. G. Tuck. R. Khaza'ie and R. G. Tuck. Muz. Mel. Tar. Tab., MMTT 279-280. First record for north central Iran. Submitted by ROBERT G. TUCK, Jr.

FLORIDA NEEDS INFORMATION

A new impact study of the Cross Florida Barge Canal is now being initiated by the Corps of Engineers. The Florida Game and Freshwater Fish Commission will direct the wildlife portion of the study which will include the amphibian and reptile analysis. We will announce the personnel involved in the herp study when we learn their names. This project could have significant primary and secondary impact on the herps of the area, including those in the Ocala National Forest. To insure that these impacts are properly considered, letters from interested herpetologists would be valuable. If you have conducted any research on the herps of this area, or collected there for "recreational" purposes, you might provide this information to the research team. This will insure that the importance of the area for scientific and recreational herpetology, if any, is properly noted. Until the herpetologists are known, letters should go to:

Florida Game & Freshwater Fish Commission
4005 S. Main St.
Gainesville, Florida 32601

SSAR-HL ANNUAL MEETINGS

11 - 14 AUGUST 1975

CALIFORNIA STATE UNIVERSITY, FULLERTON

Tentative Schedule of Events:

17 Aug., Sunday	- 1200-1600	- Registration, SSAR Board Meeting (1600)
18 Aug., Monday	- 0800-1200	- Registration
	- 1300-1630	- Contributed Papers and/or Symposia
	- 2000- ??	- Evening Social
19 Aug., Tuesday	- 0900-1200	- Contributed Papers and/or Symposia
	- 1330-1530	- Contributed Papers and/or Symposia
	- 1600-1800	- SSAR Business Meeting
	- 1800-2100	- Informal Dinner
20 Aug., Wednesday	- 0900-1200	- Contributed Papers and/or Symposia
	- 1330-1630	- Contributed Papers and/or Symposia
21 Aug., Thursday	- Field Trips	

All meetings are scheduled on the Cal. State Univ., Fullerton Campus. Dormitory facilities adjacent to campus are available. They consist of rooms with private bath facilities. The fee schedule is based on the number of room occupants per day and is as follows: one - $6.00, two - $7.00, three - $9.00, and four - $11.00. Several moderately priced motels are within three to five miles of the campus. Dining facilities will be available at the dormitory. A meal package is available for Sunday dinner through Thursday breakfast for $20.00 (11 meals), ALL you can eat! Several restaurants are within easy walking distance of the campus.

Additional information, including travel hints and maps, will be mailed to pre-registrants. This information is also available on request from William Presch or John W. Wright.

CALL FOR PAPERS FORM

Contributed Paper:

Author(s) and Address(es) _____

_____

_____

Title _____

_____

_____

Time needed (15 min. maximum): _____ minutes

Projection equipment needed: _____none, ____35 mm., ____lantern slide, ____motion picture.

Is this paper to be considered in the Student Prize Competition? ____yes, ____no.

Abstract: Type abstract (100 words maximum) on a separate sheet of white paper. Restrict abstract to one paragraph headed by the name(s) of the author(s) and title of paper. Paragraph should be no wider than 105 mm. and double spaced.

Return this form and abstract by 1 June 1975 to JOHN W. WRIGHT, SECTION OF HERPETOLOGY, NATURAL HISTORY MUSEUM, LOS ANGELES, CALIFORNIA 90007.

Symposium: I plan to organize a symposium on _____ _____ with a total of _____ participants which would occupy _____ minutes of program time. I am fully aware that to be included on the program that I am responsible for gathering the individual titles and abstracts and for transmitting same to John W. Wright by 1 June 1975.

Signed _____.

PRE-REGISTRATION FORM

The pre-registration fee is $8.00 ($5.00 for students). Registration after 1 August is $10.00 ($7.00 for students). The registration fee includes the costs to the local committee for coffee breaks, evening social, printing, mailing, etc.

NAME _____

ADDRESS _____

_____

_____ Zip Code _____

Membership: _____ SSAR, ____ HL, ____ both, ____ neither

Pre-registration fee(s) at $8.00 ($5.00 for students)..$_____

*Anticipated number of nights in dormitory..... _____

*Anticipated number in dormitory room..... _____

*Meal package at $20.00 (exclusive of informal dinner)..... _____

(*Dormitory fees are payable in advance on arrival)

Group photographs (B & W, 8 x 10) at $1.75 each.....$_____

MAKE CHECK OR MONEY ORDER PAYABLE TO SSAR-HL FULLERTON

TOTAL.....$_____

FIELD TRIPS (Cost Sharing)

I (we) would like to participate in one of the following (indicate number, if more than one):

One-day desert trip_____

Overnight desert trip_____

One-day excursion to San Diego (Zoo and Nat. Hist. Mus., ca. $4.00)_____

Los Angeles Zoo_____

LACMNH _____

Return this form by 1 August 1975 to WILLIAM PRESCH, DEPARTMENT OF BIOLOGY, CALIFORNIA STATE UNIVERSITY, FULLERTON, CALIFORNIA 92631

SOCIETY FOR THE STUDY OF AMPHIBIANS AND REPTILES

Bell's HERPETOLOGY OF THE "BEAGLE"

EDITED BY CHARLES DARWIN

with a new Preface by ROBERTO DONOSO-BARROS *(Chile)*

About 100 pages, 20 plates, 8 1/2 by 11 inches, originally published in London, 1843

The round-the-world voyage of the H.M.S. *Beagle* (1832-36) under the command of Captain FitzRoy, was to have a profound effect on the science of biology. Young Charles Darwin, naturalist to the expedition, not only collected the specimens, but also edited and superintended the classic work *The Zoology of the Voyage of the H.M.S. Beagle*, written by various authors. The British naturalist Thomas Bell was responsible for Part V, dealing with amphibians and reptiles.

This classic monograph, long out of print, contains detailed descriptions of 46 species (including six new genera and 25 new species) of amphibians and reptiles. Most of the material was collected in South America, but species are described from Africa, Australia, Tasmania, New Zealand and Mauritius. Nearly all species are beautifully illustrated in 20 finely engraved plates.

prices

SSAR members *before publication*: $4 paper, $8 cloth
Institutions and Non-members: $9 paper, $13 cloth

to order

Orders may be placed now. This book will be published in Fall 1975; to take advantage of special prices, *SSAR* members must place their orders *before publication.*

Please circle edition desired and send with payment to Dr. Henri C. Seibert, Morton Hall, Ohio University, Athens, Ohio, USA 45701. Make checks payable to "SSAR." Receipt sent on request only. Mark these boxes if you want information on *SSAR* membership ☐ or a complete list of Society publications ☐.

CARIBBEAN RESEARCH

MARGARET M. STEWART (Dept. of Biological Sciences, State University of New York, 1400 Washington Ave., Albany, New York 12222) is currently conducting research on niche breadth and competitive interactions between sympatric species of Jamaican Eleutherodactylus. Investigations include habitat specializations, spatial relationships, food habits, reproductive potential, and possible character displacement for species pairs. Special attention is being given to ecological relationships between two introduced species, E. johnstonei and E. planirostris, and how they co-exist with native species assemblages.

- - - - - - - - - - - - - - - - - -

CARL H. ERNST (Dept. of Biology, Geroge Mason University, Fairfax, Virginia 22030) has initiated a taxonomic study of the genus Rhinoclemys. He hopes to eventually expand the project into an ecological study of R. punctularia on Trinidad.

CATALOGUE OF AMERICAN AMPHIBIANS AND REPTILES

(Now published by the SSAR)

****

A loose-leaf series of 2- to 4- page species accounts of the amphibians and reptiles of the Americas, with special emphasis on those in the United States and Canada. Accounts 1-150 were published from 1963 to 1972.

Binder, Taxonomic Tabs, and Accounts 1-150.

Individuals.....$ 25.00
INSTITUTIONS.....$ 35.00

Subscription for 1973

REQUEST FOR LIVE HYLA

Conrad Weiler (Institut für Humangenetik und Anthropologie der Universität Freiburg, 78 Freiburg im Breisgau, Albertstrasse 11, Freiburg, Germany) needs 10-30 live individuals of Hyla versicolor and 10-30 live individuals of either H. andersonii, H. regilla, or H. chrysoscelis. The animals may be sent by air mail, C.O.D. and payment will be made for the individual animals. He would also like information on maintenance of Hyla in captivity(breeding, food, temperatures, etc.).

SOCIETY FOR THE STUDY OF AMPHIBIANS AND REPTILES

****

Membership is open to anyone who is interested in amphibians and reptiles.

Members have voting privileges in the Society. They receive the JOURNAL OF HERPETOLOGY (3 - 4 issues/year), HERPETOLOGICAL REVIEW (4 issues/year), HERPETOLOGICAL CIRCULARS, and FACSIMILE REPRINTS IN HERPETOLOGY (2-3 issues/year). They may purchase other Society publications at reduced rates.

Student Member.....$ 8.00

Regular Member.....$ 10.00

Sustaining Member.....$ 15.00

Contributing Member.....$ 20.00

INSTITUTIONAL SUBSCRIPTION to "SSAR Package" (J HERPETOL, HERP. REVIEW).....$ $20.00

Eight papers were candidates for the Herpetologists League Student Prize competition at the SSAR-HL meeting at Auburn University, Alabama, on 14 August. The HL Student Prize Committee, consisting of Roy McDiarmid, George Zug and Joseph T. Collins (chairperson) voted to award the $25.00 prize to Richard C. Vogt for his presentation entitled "Systematics of the Graptemys pseudogeographica complex." Mr. Vogt is a student at the University of Wisconsin. The committee further congratulates James F. Berry, University of Utah, and Steven P. Christman, University of Florida, for their high quality papers in the student prize competition.

HERPETOLOGY AT THE UNIVERSITY OF CHICAGO

The professional herpetological staff at the University of Chicago has increased rapidly in the past few years. There are now six faculty members actively studying the biology of amphibians and reptiles.

Steve Arnold, Asst. Professor, Dept. of Biology, is investigating the courtship behavior of salamanders and the ecology and evolution of feeding preferences in snakes. Robert Inger, who is currently President of American Society of Ichthyologists and Herpetologists and a lecturer in the Committee on Evolutionary Biology, is studying the structure and organization of communities of reptiles and amphibians in tropical forests. Eric Lombard, Asst. Professor of Anatomy, is studying hearing in frogs in order to understand the morphological bases of acoustical communication in anurans. He is also pursuing studies on the functional morphology of feeding and locomotion in salamanders. Hy Marx is a lecturer in the Committee on Evolutionary Biology as well as Curator of Herpetology at the Field Museum of Natural History. His time is divided by curatorial activities and collaborative studies with Harold Voris and George Rabb on the phylogeny of sea snakes, vipers, and other "advanced" groups of snakes. The Chicago Zoological Park (the Brookfield Zoo) is George Rabb's home base and, although administrative activities keep him quite busy, he maintains Lectureship posts in both the Committee on Evolutionary Biology and the Dept. of Biology at the University. Along with studies on snake phylogeny George and his wife Mary continue research on the evolution of breeding behavior of frogs. Richard Wassersug is an Asst. Professor in the Dept. of Anatomy where he works on morphology, ecology and behavior of amphibian larvae. His primary emphasis is on feeding adaptations of tadpoles.

The University of Chicago has cooperative programs with many other schools and institutions in the Chicago area. It is not uncommon for graduate students at the U. of Chicago to do their research at the Brookfield Zoo, the Field Museum or some more distant location such as Borneo or Guatemala. Herpetology students currently enrolled at the University of Chicago are working on projects that range from the limb anatomy of terrestrial salamanders to the feeding biology of Natrix. Students interested in studying herpetology at the University of Chicago may enroll in the Dept. of Anatomy, the Dept. of Biology or the Committee on Evolutionary Biology.

The Senate has passed a bill to designate 49,097 acres in southern Virginia as the Great Dismal Swamp National Wildlife Refuge. A 40% interest in the property was donated by the Union Corp., which plans to donate the remaining 60% interest over a four-year period. The refuge will include Lake Drummond, located near the center of the Great Dismal Swamp, which comprises about 385,000 acres between Norfolk, Va. and Elizabeth City, N.C. (The Milwaukee Journal, 8 Sept. 1974)

GEOGRAPHIC DISTRIBUTION

HERPETOLOGICAL REVIEW publishes brief notices of new geographical records in order to make them available to workers in published form. The STANDARD FORMAT for a record is:

SCIENTIFIC NAME (Common name). Locality (air-line distance to nearest town); date; collector. Identified or verified by. Place of deposition and catalogue number. Comments. SUBMITTED BY. address.

Please submit new records in STANDARD FORMAT (short manuscripts are acceptable when data cannot be adequately presented in standard format) to Geroge R. Zug, Division of Amphibians and Reptiles, National Museum of Natural History , Washington, DC 20560.

Recommended citation: Jones, J. 1974. Geographic Distribution: Rana pipiens . Herpt. Rev. 5(1):1.

CAUDATA

AMPHIUMA MEANS (Two-toed amphiuma). U.S.A., Virginia, Hanover Co., 2 miles N. Mechanisville; 5 March 1974; Wayne A. Fussel. J.C. Mitchell. Virginia Commonwealth Univ., VCU 326. An approximate 20 mile range extension to the north of the previously known northern most locality in New Kent Co., Va. (Salthe, Cat. Amer. Amphib. Rept., 1973: 148.1). Submitted by JOSEPH C. MITCHELL, 3200 Stuart Ave., Apr. 2, Richmond, VA 23221.

SALIENTIA

RANA AREOLATA CIRCULOSA (Northern crawfish frog). U.S.A., Arkansas, Craighead Co., about 4 miles NE Jonesboro; 12 March 1973. W. Bryd, E.L. Hanebrink. E. L. Hanebrink. Arkansas State Univ., ASU 1289-92. Extends the range across the Mississippi River into northeastern Arkansas. Submitted by WILLIAM BYRD and EARL L. HANEBRINK. Division of Biological Science, Arkansas State University, State University, AR 72467.

TESTUDINES

KINOSTERNON FLAVESCENS FLAVESCENS (Yellow mud turtle). U.S.A.,Missouri, Barry Co., 5.6 kilometers W Exeter; 6 June 1964; C. Balch, D. Smith. D. Smith. University of Missouri-Kansas City, UMKC 726. Second specimen recorded from Missouri and extends the range 80.5 km SE of the original Jasper Co. record (Anderson, 1965, Reptiles of Missouri). Submitted by DONALD D. SMITH, Department of Biology, University of Missouri-Kansas City, Kansas City, Missouri 64110 and LON C. BALCH, Naturalist-Ranger, Lake of the Ozarks State Park, Kaiser, Missouri 65047.

SAURIA

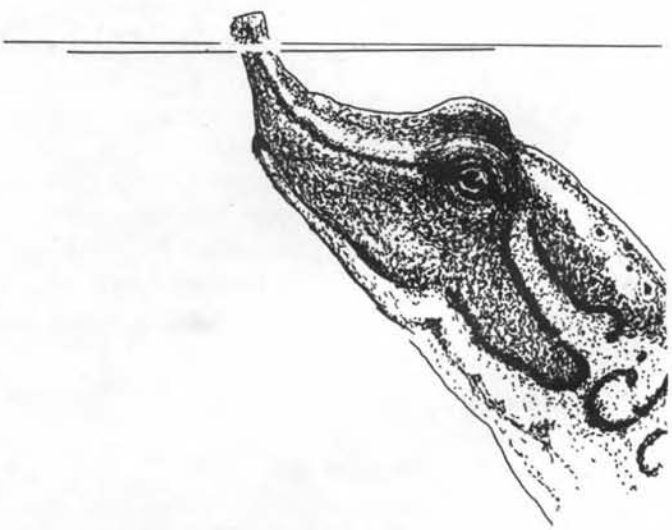
EUMECES GILBERTI ARIZONENSIS (Arizona skink). U.S.A. Arizona, Mohave Co., Burro Creek, ca 2450 ft. about 15 kilometers W Bagdad; 6 April 1974; P.A. Medica. P.A. Medica. Arizona State Univ., ASU 14486. Extension of the range approximately 79 kilometers to the west. First record for county. Additional Arizona records are: Yavapai Co., Alkaline Spring, 1.3 k E Castle Rock, ca 2464 ft., Santa Maria Mts., 7 July 1972. R.D. Ohmart. R.D. Ohmart. ASU 14509. Yavapai Co., Willow Spring, ca 5000 ft., Santa Maria Mts., 4 July 1972. R.D. Ohmart. R.D. Ohmart. ASU 14508. Extends the known range approximately 40 k to the WNW. First records for the Santa Maria Mts. Yavapai Co., 16 k E Crown King, ca 3000 ft., Bradshaw Mts., June 1973. L.J. Vitt. L. J. Vitt. Not preserved.

Extends the known range approximately 45 k SE to the eastern slopes of the Bradshaw Mts. Submitted by PHILIP A. MEDICA, P.O. Box 495, Mercury, NV 89023 and LAURIE J. VITT, Department of Zoology, Arizona State University, Tempe, AZ 85281.

SERPENTES

CARPHOPHIS AMOENUS HELENAE (Midwest worm snake). U.S.A., Indiana, Franklin Co., Franklin County Park, at Brookville; 13 April 1974; M.H. Kerr. M. J. Lodato. Univ. Michigan Mus. Zoo., UMMZ 133294. First record for county; establishes northern limit of distribution for extreme eastern Indiana. Submitted by MICHAEL J. LODATO, Middle Mississippi Valley Herpetologists, 925 Park Plaza Dr., Evansville, IN 47715.

MASTICOPHIS BILINEATUS BILINEATUS (Sonora whipsnake). U.S.A., Arizona, Mohave Co., Burro Creek, ca 2450 ft. about 15 kilometers W Bagdad; 7 April 1974; P.A. Medica, B. G. Maza. P. A. Medica. Arizona State Univ., ASU 14488. Extension of the range approximately 136 kilometers to the west. First record for Mohave County. Submitted by PHILIP A. MEDICA and BERNARDO G. MAZA, P.O. Box 495, Mercury, NV 89023.



NATRIX TAXISPILOTA (Brown water snake). U.S.A., Virginia, Chesterfield Co., 10 miles SE Richmond, Presquile Wildlife Refuge; 22 January 1974; S. Jackson. J. C. Mitchell. Virginia Commonwealth Univ., VCU 165. 16 April 1974; C.R. Blem, C.R. Blem. VCU 372-373. Range extension of approximately 20 miles west of the previously known most northern locality in New Kent Co., Va. (Virginia Herp. Soc. range map). Submitted by JOSEPH C. MITCHELL.

TROPIDOCLONION LINEATUM LINEATUM (Northern lined snake). U.S.A., Missouri, Miller Co., near Iberia; 4-5 May 1974; J. P. Ward. J. P. Ward. Collection of J.P. Ward, JPW S107-109. First specimens from central Missouri (specimens reported in Herp. Review 5(2) lost in transit); in rocky debris after heavy rain. Submitted by JOSEPH P. WARD, 212 Allen, Goldsboro, NC 27530.

Albino Toad Found in Michigan - Continued

The albino Bufo americanus found by a four year old in Warren, Michigan and subsequently given to the Amphibian Facility of the University of Michigan, initiated unusual activity by teenagers in that area. A total of 14 "albino" Bufo americanus have been found. Most were found within a few blocks of the original animal. Others were within an area 15 miles in diameter. The animals are apparently from the 1973 mating season and pose some interesting questions either of gene flow in the Rouge River and Red Run water shed or of sibling dispersal in the heart of the metropolitan Detroit area. The animals are currently under examination and it is premature to detail the nature of their albinism. It is anticipated that progeny may be obtained in the not too distant future.

Snorkel nose of soft-shell turtle, Trionyx ferox. (Drawing by Roberta Plummer, MPM).

STATISTICS OF CHRYSEMYS RUBRIVENTRIS HATCHLINGS FROM MIDDLESEX COUNTY, VIRGINIA

Few data are available on hatchlings of Chrysemys rubriventris. Carr (1972) stated the shell length is 30-32 mm. Graham (1971) gave the following data on four hatchlings of C. r. bangsi from Plymouth, Mass.: mean carapace length of 30.1 mm (29.3-31.0), mean plastron length of 28.5 mm (28.1-29.3) and mean weight of 7.7 g. (6.9-7.9). The only data from Virginia are on egg size, these averaging 19 x 25 mm depending on size of the female (Smith, 1904).

On 13 April 1974, sixteen C. rubriventris hatchlings were collected from Middlesex County, Virginia, 3.5 miles SE of Saluda. The nest was in sandy loam on the edge of a dirt road ca. 250 meters north of the Piankatank River. Three hatchlings had already emerged upon discovery and excavation revealed 13 others, some in a state of stupor, 15 cm from the surface. The entrance was in the shape of a slot approximately the size of the hatchlings. None of them bore yolk sac remains or a caruncle although umbilical scars were present.

Fifteen of the hatchlings were made available to the author five days after capture. Measurements were taken with Helios dial calipers, metric tape and a triple beam balance. These data are summarized in Table 1.

A comparison of the data with that of Carr (op. cit.) and Graham (op. cit.) shows an average difference in carapace length of 5 mm, plastron length of 5 mm and weight of 1.7 g. This, along with the emergence date, supports the statement by Ernst and Barbour (1972) that this species "...may overwinter in the nest and emerge in the spring".

ACKNOWLEDGMENTS: I thank W. C. Rothery for providing the turtles and Drs. C.R. Blem, J.F. Pagels and G.R. Zug for criticizing the manuscript. One specimen was donated to the Virginia Commonwealth University Vertebrate Collection, VCU 418, and the others released.

NEW PUBLICATIONS

The REVISTA DE BIOLOGIA TROPICAL, published by the Universidad de Costa Rica, has just issued the second part of its 21st volume (dated May 1974), which features several herpetological papers: on helminth parasites of Nevada bullfrogs (Babero & Golling), on Costa Rican coral snakes (Savage & Vial), and geographical distribution of Costa Rican venomous snakes (R. Taylor et al.). Herp papers total some 85 of the 250 pages of the present issue. Other articles of interest to vertebrate biologists include plasma protein microelectrophoresis of some poeciliid fishes, behavior of Poecilia latipinna, Mexican cichlid fishes, and food habits of some Costa Rican bats.

The Revista de Biologia Tropical (Journal of Tropical Biology) was started in 1953 by the Universidad de Costa Rica and, unlike most Latin American scientific journals, it has appeared twice yearly with hardly any interruptions. Although initially the Revista was heavy with tropical medicine and parasitological papers, the present emphasis seems to be on taxonomic and ecological papers of tropical plants and animals, although occasionally papers on extra-tropical taxa appear. Many of the papers published in the Revista are the result of research done by participants in the Organization for Tropical Studies (OTS) program or by University of Costa Rica staff, although these affiliations are by no means prerequisite for publication in the Revista.

In past years, the Revista has published papers by many herpetologists, including Carr, Caldwell, Duellman, Greding, Heyer, Kluge, Thomas, Tamsitt, Savage, Schwartz, Valdivieso, Vial and Villa. Many factors have attracted authors --from many countries-- to submit manuscripts to the Revista. It is a reasonably old, respected journal, with a well known, elegant, format. Papers are usually well edited, and painstaking attention is given to the smallest details of presentation. Submission-to-publication time varies, but usually it is about a year for short papers (10 p. or less). Longer papers, and color plates, may be subsidized to expedite publication. Authors receive 100 free reprints if they are regular subscribers, 50 if not. Subscription costs $5.00 a year, and additional reprints usually cost less than half than they would in the US. The main disadvantage is the delay due to mailing which is about 3 months for Costa Rica-US surface mail (air mail delivery can be arranged).

Jaime Villa
Cornell University

AMPHIBIANS: Guidelines for the Breeding, Care, and Management of Laboratory Animals. 1974. National Academy of Science, Wash., D.C., 153 p.

The Subcommittee on Amphibian Standards of the National Research Council has reviewed the literature on amphibian culture and has produced an excellent synthesis of our knowledge. Anyone keeping live frogs and salamanders will find the guide an invaluable aid in keeping healthy amphibians. The coverage is best shown by listing chapter heading and some of their subsections: 1) Introduction; 2) Classification and description of amphibians commonly used for laboratory research; 3) Definition and description of experimental amphibians; 4) Sources-selection; dealer care; ordering, shipping and receiving; legal aspects; 5) Physical facilities - relation to natural habitat; amphibian quarters; enclosures; 6) Amphibian management and laboratory care; 7) Breeding; 8) Records and information control - identification of individuals; 9) Amphibian medicine - bacterial diseases: viral diseases; parasitic diseases; mycotic diseases; euthanasia and anesthesia; 10) Personnel; Appendices on endangered amphibians and control law by states and Canadian provinces; References. Copies of this guide can be purchased for $5.25 from National Academy of Sciences Printing and Publishing Office, 2101 Constitution Avenue, Washington, D.C. 20418.

George Zug
National Museum of Natural History

The following are abstracts of papers presented at the 1974 SSAR-HL meetings at Auburn University, Auburn, Alabama, 12-14 August 1974.

* * * * * * * * * * *

BERRY, JAMES F. (University of Utah). Character convergence in the musk turtles, Sternotherus minor and S. odoratus, in northern Florida.

Populations of Sternotherus minor and S. odoratus were compared between five localities where the species were ecologically allopatric and two localities where they were ecologically sympatric. It was determined that the species compete for food resources at localities where they are sympatric since they overlap considerably in resource utilization and do not partition resources spacially or temporarily. S. minor loses its specialized mollusk-eating adaptations and becomes morphologically similar to S. odoratus at localities where the species are sympatric, or where the snail Goniobasis is not available as a food source. It is suggested that "character convergence" has been demonstrated.

* * * * * * * * * * *

CHRISTEIN, DEBRA R., and DOUGLAS H. TAYLOR (Miami University of Ohio). Social facilitation in celestial orientation of Rana catesbeiana tadpoles.

Four different groups (n=1; n=10; n=20; and n=40) of bullfrog tadpoles (R. catesbeiana) were trained underneath the sun to a specific shoreline, simultaneously but in separate training tanks. All groups were tested individually in an aquatic outdoor circular orientation arena at periodic intervals for a period of twenty days. Learning curves were then constructed for each group with respect to time required to learn the shoreline associations. Our data indicate that the number of individuals in a training group has a definite effect on the rapidity of learning new shorelines with increased numbers having an inhibitory effect on learning rate.

* * * * * * * * * * *

CHRISTMAN, STEVEN P. (University of Florida). Giant rattlesnakes and skeletal morphometrics.

A multivariate method for allocating isolated snake precaudal vertebrae to the correct vertebral region is introduced. There is a direct relationship between the length of a snake and the length of its mid-body vertebrae. The holotype of Crotalus giganteus is a mid-body vertebra, and came from a snake approximately 1.9 meters (six feet, three inches) in length.

As the size of a rattlesnake increases, vertebral width increases faster than vertebral length. A simple model relating vertebral dimensions to body size is presented. Under the assumptions of this model, vertebral width should increase with body weight, while vertebral length should increase with body length.

* * * * * * * * * * *

CORSE, WAYNE, MARK BAUMAN and DEAN METTER (University of Missouri, Columbia) The economic impact of two herps on a fish hatchery.

Studies of Rana catesbeiana and Natrix sipedon on a fish hatchery showed that these two species consume fish in large enough quantities to be of economic consideration to the hatchery. Both species feed most heavily on the more valuable, slower moving goldfish in preference to faster swimming fish.

DODD, C. KENNETH, JR., and EDMUND D. BRODIE, JR. (Clemson University). Anti-predator mechanisms in selected members of the neotropical salamander Genus Chiropterotriton with comments on the effects of temperature on the immobile response.

Four species of the neotropical salamander genus Chiropterotriton (bromeliacia, didmidiatus, multidentatus, picadoi) were studied for possible anti-predator mechanisms. Based on the Central American Chiropterotriton, characterized by coil-uncoil flipping and the Mexican Chiropterotriton, characterized by a running flip. The effect of temperature on the immobile response and repeated immobilization were studied for C. multidentatus. The duration of immobility tended to be quadratic, with shortest immobility at 12°C and greatest immobility at 4°C and 20°C. Repeated immobilization resulted in neither an increase nor a decrease in the duration of immobility. Evidence for noxiousness of C. multidentatus will be presented.

DYRKACZ, STANLEY, and MICHAEL J. CORN (McHenry, Illinois and Grayslake, Illinois). Response of naive, neonate bullsnakes to water extracts of potential prey items.

Previously unfed, newly hatched bullsnakes (Pituophis melanoleucus sayi) from northeastern Illinois were tested for their responses to water extracts of twelve potential prey species. Positive response, significantly increased tongue flicking, was found only for chipmunk, field mouse, and baby chicken. It is suggested that house mice and rats are not chemically recognized because they are recently introduced species. It is also suggested that, because of visual cues, a prey item can be recognized even though chemical cues are lacking; and that visual cues can override chemical cues to cause rejection of unsuitably sized prey. Order of presentation of extracts did not influence the strength of the response, as has been reported for Elaphe.

FOUQUETTE, M. J., JR. (Arizona State University). Character displacement, and reinforcement of an isolating mechanism, in chorus frogs.

The basis for assuming mating call is the overriding isolating mechanism in sympatric species of Pseudacris is briefly reviewed, and further evidence submitted. Mating calls of Pseudacris nigrita and Pseudacris triseriata feriarum were analyzed from Florida to Kentucky, including areas of sympatry and allopatry. Divergence in sympatry in at least one species in four parameters of calls is interpreted as an example of reproductive character displacement. Pulse rate appears to be the critical parameter upon which females discriminate, and the highly significant displacement in that parameter is interpreted as reinforcement of the primary premating isolating mechanism.

FRANZ, RICHARD, and WALTER AUFFENBERG. (University of Florida). The gopher tortoise in Georgia.

Gopherus polyphemus distribution in Georgia is a series of small disjunct populations south and east of the Fall Line, confined to long-leaf pine-turkey oak communities. Both Gopherus and the plant community distribution can be correlated with Late Tertiary and recent sand deposits.

Many populations are threatened; few have recently been extirpated. Some problems facing Gopherus are: 1) removal of tortoises by humans for food; 2)construction reducing the availability of suitable habitat; 3) widespread continual use of trail bikes in these communities is killing many plant components essential to soil stabilization and tortoise food (esp. wire grass), and resultant dry, shifting sand is unfavorable for burrow construction; and 4) fire elimination in many areas results in maturing of turkey oaks causing thick leaf litter accumulations, retarding growth of wire grass and other low-growing food plants; thus reducing the tortoises' primary food supplies.

* * * * * * * * * * *

GUTTMAN, SHELDON I. (Miami University of Ohio). Isozymes in northern allopatric populations of the American toad, Bufo americanus.

Electrophoretically demonstrable variation was analyzed in enzymes encoded by 14 structural gene loci in 620 individuals representing 25 populations. Average individual heterozygosity was 11.6%, mean percentage of loci polymorphic was 25.7%, and average number of alleles detected per locus was 1.45. Extensive clinal variation in allelic frequencies and genic variability estimates was observed. Marginal populations of this species appear to be as variable as central populations. American toad possesses more genic variability than any other vertebrate species reported to date. This may be a reflection of an adaptive strategy unique to toads. (Supported by NSF Grant GB-23601)

HILLESTAD, HILBURN O., ROBERT J. REIMOLD, ROBERT R. STICKNEY, HERBERT L. WINDOM, and J. H. JENKINS (University of Georgia, Athens) (Savannah, Georgia). Pesticides, heavy metals and radionuclide uptake in loggerhead sea turtles from South Carolina and Georgia.

Loggerhead sea turtle (Caretta caretta) eggs from three nesting beaches in Georgia and South Carolina were analyzed for chlorinated hydrocarbons and heavy metals. Tissue samples were obtained from Georgia turtles for radionuclide analysis. Total DDT (DDE + DDD + DDT) residue levels ranged from .058 ppm to .305 ppm. Dieldrin residue levels ranged from trace to .0564 ppm. Mercury levels in yolks ranged from 0.02 ppm to 0.09 ppm and 0.01 ppm to 0.03 ppm in the albumen. Zinc levels averaged 32.25 ppm in yolk and 26 ppm in the albumen. There were significant differences between the yolk and albumen levels of cadmium, copper and lead. Cadmium levels averaged 0.17 ppm in yolk and 0.56 ppm in albumen; copper levels averaged 2.08 ppm in yolk and 6.0 ppm in albumen; lead averaged 2.87 ppm in yolk and 12.0 ppm in albumen. Radionuclide detection for the gamma emitters revealed very low levels in tissue samples. Levels were found to be much lower, by several orders of magnitude, than in other coastal reptiles, mammals and fish.

JUDD, FRANK W. (Pan American University of Texas). Activity and home range ecology of the keeled earless lizard, Holbrookia propinqua.

A field study of the ecology of the keeled earless lizard, Holbrookia propinqua, was conducted from July 1969 to September 1971 on study areas situated on South Padre Island, Cameron County, Texas. H. propinqua is active throughout the year, but activity is limited to relatively warm days in winter. Diel activity is bimodal during clear, hot days and unimodal during cool days. Males move significantly farther per hour than females due to the fact that males move farther per move rather than more often than females. Home range size was estimated by minimum polygon and probability density function methods. Both methods showed male home ranges to be larger than those of

females. Juvenile home range size was similar to that of adult females. Information on temporal variability of home ranges and the relation of home range size to vegetational cover and population density are presented.

JUSTIS, C. SUE, and DOUGLAS H. TAYLOR (Miami University of Ohio). Extraocular photoreception and compass orientation in larval bullfrogs, Rana catesbeiana.

Eyeless larval bullfrogs (Rana catesbeiana) possess extraocular photoreceptors (EOP's) for perception of celestial cues for spatial orientation. It appears that the pineal gland (epiphysis cerebri) and the frontal organ (stirnorgan) are the effective EOP's utilized in this response. Additionally, both of these EOP's are capable of perceiving photo-period changes for purposes of biological clock synchronization.

McDIARMID, ROY W., W. RONALD HEYER, and DIANA L. WEIGMANN (University of South Florida, National Museum of Natural History and University of Kansas). Tadpoles, predation and pond size in the Tropics.

Tadpoles involved in predator-prey interactions were studied under laboratory and field conditions in tropical wet forest in Costa Rica. Larvae of Leptodactylus pentadactylus and naiads of the odonate Pantala flavescens are important predators on larvae of several species of frogs. Feeding experiments elucidated the nature of the predator-prey interactions. Interestingly, both predators and prey are inhabitants of small ephemeral puddles. A model is used to illustrate the relationships between predation and pond size as they affect the composition of the tadpole community. The predatory feeding mode of tadpoles is considered in light of this model.

* * * * * * * * * * *

MILLER, KIRK, and GARY C. PACKARD (Colorado State University). Altitudinal variation in critical thermal maximum of chorus frogs (Pseudacris triseriata).

Critical thermal maxima (CTMs) were determined for chorus frogs collected along an altitudinal gradient running from the piedmont of northcentral Colorado to high park-lands in the Front Range of the Rocky Mountains. There is an inverse, linear correlation between CTM of chorus frogs and altitude. Since montane habitats are characterized by generally cooler conditions than are piedmont and intermediate localities, the reduction in CTM of chorus frogs with increasing elevation presumably represents an outcome of physiologic adaptation by the frogs to their respective thermal environments. A relatively low CTM may indicate that rate-limiting enzymes in intermediary metabolism function optimally at relatively low body temperatures.

REDMOND, WILLIAM H., and ROBERT H. MOUNT (Auburn University). Amphibians and Reptiles of coastal plain affinity found within the Coosa Valley, Appalachian Ridge and Valley Province, Alabama.

Within the Appalachian Ridge and Valley province, the Coosa Valley stretches from northeastern to central Alabama. It is approximately 125 miles long and varies from 5 to 30 miles wide. Nine species of amphibians and reptiles which are usually associated with the Coastal Plain have been reported to occur within the Coosa Valley. The zoogeographical significance of the presence of these 9 species will be discussed and interpreted in terms of present ecological conditions and past geological events.

* * * * * * * * * * *

ROSE, FRANCIS L.(Texas Tech University). Tumorous growths on A. tigrinum associated with treated sewage effluent.

Neotenic Ambystoma tigrinum inhabiting the treated sewage effluent pond at Reese AFB (Hurlwood, Texas) have the highest tumor rate of any reported populations. Thirty three per cent of the animals have one or more of six basic types of growths. Samples of 30,000 larvae from non-sewage ponds have failed to yield a single individual with an external growth. Current evidence indicates that the causitive agent may be a polycyclic hydrocarbon.

* * * * * * * * * * *

SANDERSON, ROGER A. (University of South Florida). Sexual dimorphism in Malaclemys barbouri.

Sexual dimorphism and growth in the Barbour's Map turtle was studied in the field and laboratory from 1971 through 1973. Emphasis was placed on differences in growth rate, form of the shell and skull and food habits. Significant differences in several characteristics were found between males and females of the same size. At maturity females are more than twice the size and six times the age of males. Increase in reproductive potential, combined with differential food utilization, are postulated as the main selective forces determining dimorphism in this species.

* * * * * * * * * * *

SATTLER, PAUL, and SHELDON GUTTMAN (Miami University of Ohio). An electrophoretic analysis of the melanistic phase of the Eastern garter snake Thamnophis sirtalis sirtalis.

Within the range of Thamnophis s. sirtalis is an area which has garter snakes exhibiting a high frequency of melanism. Melanistic specimens as well as normally-colored specimens from sympatry and allopatry were examined with the technique of horizontal starch gel electrophoresis. The results will be discussed, and may indicate the degree of gene flow between the color morphs. Also to be discussed are possible mechanisms of selection for the black color morph.

* * * * * * * * * * *

SHEALY, ROBERT M. (Pensacola Jr. College). Reproduction in the Alabama Map turtle, Graptemys pulchra, in Alabama.

In Alabama Graptemys pulchra, males reach sexual maturity in about 3 years and females in about 14 years. Mature females average over 10 times the weight of mature males. Male courtship behavior is apparently similar to that in other aquatic emydines, except that the "titillation tool" is the snout of the male rather than the fore claws. Reproductive potential varies from 7 to 71 (Ave.=29), depending on the size of the female. Nesting occurs from May through July, with the deposition of from 1 to 6 clutches of eggs per female per season. Predators (raccoons and crows) destroy over 95% of the nests in some areas. Incubation requires about 76 days. An interval of from several days to a week occurs between hatching and emergence of hatchlings from the nest. No evidence of hatchlings overwintering in the nest has been found.

* * * * * * * * * * *

SMITH, DONALD D. (University of Missouri at Kansas City). Population structure, growth and reproduction of two species of Cnemidophorus; one unisexual and one bisexual.

During the summers of 1968 and 1969 certain aspects of the life history of two species of Cnemidophorus (C. gularis Baird and Girard, a bisexual species and C. exsanguis Lowe, reproducing via parthenogenesis) were studied near Alpine, Brewster County, Texas. Sex ratios were equal for C. gularis and no male C. exsanguis were found. C. exsanguis reached reproductive maturity at the age of about ten months, but most of the female C. gularis did not reach maturity until their second reproductive season. There was a direct relationship between snout-vent length and clutch size, and old adults of both species probably laid two clutches of eggs.

* * * * * * * * * * *

SMITH, GARY C. (Furman University). Assimilation efficiencies of ectothermic vertebrates.

Assimilation efficiencies were measured for three lizard, four snake and one toad species. Domestic crickets, southern toads and a strain of laboratory mice were the food items offered. All values for food and feces were converted to caloric equivalents for comparison. Gut clearance ranged from a low of 1.8 days for Cordylus warreni, the armadillo lizard, on a diet of crickets to 7.1 days for Bufo terrestris on the same diet. Assimilation percentages ranged from 60.9 percent for Eublepharus macularis on a cricket diet to 88.9 percent for the corn snake, Elaphe guttata on a mouse diet. Assimilation percentages were not affected by temperature or amount of food consumed per feeding. Efficiences were related primarily to the specialization of each species on particular food items.

* * * * * * * * * * *

STARNS, MARCIA and DOUGLAS H. TAYLOR (Miami University of Ohio). Sun compass orientation in the red-spotted newt, Notopthlamus viresdecens.

Red-spotted newts were trained to a particular compass direction outdoors in training tanks having an artificial shore at one end and water at the other end. The animals were periodically removed from the water and placed upon the shore where they were allowed to find their way back to water. Orientation tests in an aquatic circular arena, from which only celestial cues were visible indicated that these newts were capable of sun compass orientation and that their orientation was directed toward deep water, i.e. in a direction that would have returned them to deep water had they been in the training tank.

* * * * * * * * * * *

TIHEN, JOSEPH A. (University of Notre Dame). The fossil frog genus Miopelodytes.

Miopelodytes has previously been known only from the type specimens, from the middle Miocene of Nevada. Additional specimens, consisting mostly of dissociated bones, from the Oligocene of Nevada and the lower Miocene of Montana, confirm the relationship of Miopelodytes to the modern genus Pelodytes. Some features of the fossils resemble Eopelobates and/or discoglossids. Confirmation of the familial relationships of the fossils along with reexamination of morphological features of the modern genus, leads to interesting paleozoogeographic and phylogenetic speculations.

VIAL, JAMES L. (University of Missouri, Kansas City). Thermal related activity in the mesoamerican lizard, Gerrhonotus monticolus.

Studies on temperature correlated activity in G. monticolus were conducted on the Cerro de la Muerte of Costa Rica at elevations above 2,780 m. Over a body temperature range of 8.6° to 27.2°C

this lizard is active only above 20.2°C, and is entirely diurnal. Close correlation is demonstrated between body and substratum temperatures. Comparisons with other gerrhonotine lizards indicate that G. monticolus has the highest voluntary minimum temperature within the group for which information is available, while its overall thermal range is intermediate to other Gerrhonotus.

* * * * * * * * * *

VIAL, JAMES L. (University of Missouri, Kansas City). Demographic characteristics of a Kansas population of copperheads (Agkistrodon contortrix).

Applications of quantitative methods to a population of Agkistrodon contortrix are used to develop life tables, survivorship curves, fertility tables and generation time. The derivation of these biological characters, based upon a study by H.S. Fitch, is used as an example by which the existing herpetological literature may be exploited to generate data on biological phenomena not included in the original report.

* * * * * * * * * *

VOGT, RICHARD CARL (University of Wisconsin, Madison). Systematics of the Graptemys pseudogeographica complex.

The confusion among herpetologists regarding the taxonomy of the false map turtle complex G. p. kohni, G. p. pseudogeographica, G. p. ouachitensis, and G. p. sabinensis has made much of the ecological and life history data for this group unreliable. Head patterns, shell markings, shell measurements, skeletal anatomy, habitat separation, geographic distribution, food partitioning, and blood protein structure are being examined. Data regarding the external morphology and distribution are presented. One population in the Mississippi River in Wisconsin was studied intensively. Morphological data were collected from 808 adults and 50 clutches of young from known females in this population. In addition 1740 specimens were examined from throughout the entire range of this group. Data analyzed to date suggest that G. p. pseudogeographica and G. p. kohni are one species distinct from G. p. ouachitensis and G. p. sabinensis. Morphological characters are presented to separate the two groups.

* * * * * * * * * *

WEATHERBY, CRAIG A. and SHELDON I. GUTTMAN (Miami University of Ohio). Population Genetics of the Queen Snake, Regina septemvittata.

An attempt was made, utilizing horizontal starch gel electrophoresis, to determine the genetic differentiation between populations of Regina septemvittata. Of particular interest were the isolated populations of this species. Approximately 20 animals were taken from each of six populations. Gravid females were sacrificed after they gave birth and the young of these broods were also analyzed.

* * * * * * * * * *

ZEMKO, RONALD G. (Miami University of Ohio). The occurrence and distribution of turtles in Ohio.

An extensive survey of museum collections, college and university teaching collections, and material collected by professional herpetologists revealed significant changes in the distribution of Ohio's chelonian herpetofauna during the last quarter century. Since the publication of Roger Conant's 1951 edition of The Reptiles of Ohio, at least one previously overlooked species (Graptemys pseudogeographica) was added to the list of Ohio's turtles, and the distribution of previously existing species was shown to be significantly altered. Ranges of individual species have been diminished by spreading urbanization, environmental deterioration, and habitat destruction. Numerous range extensions, reported since 1951, were verified.

THE SIGMA XI GRANTS-IN-AID OF RESEARCH AWARDS FOR 1973-74 AND 1974-75 IN "HERPETOLOGY"

Awards for 1973-74

STEVAN J. ARNOLD, University of California, Santa Barbara. Courtship behavior in Guatemalan salamanders of the family Plethodontidae. $150.

FRANKLIN G. HEMPEL, Duke University Medical Center. Fluorescence spectra of isolated frog retina. $150.

JAMES S. JACOB, University of New Mexico. Biotelemetric monitoring of activity patterns and physiological parameters of three species of Crotalus in New Mexico. $200.

CHARLES E. KROON, University of Chicago. A functional morphological investigation of the feeding mechanism of colubrid snakes. $125.

LYNNE M. MILLER, Rutgers University. Nesting behavior of a southern population of diamondback terrapins. $150.

JOHN D. RAMER, Virginia Polytechnic Institute and State University. The relationship of mating call quality of Rana clamitans to territorial behavior and sexual selectivity. $350.

FREDERICK C. SCHLAUNCH, Cornell University. The ecology of amphibians and reptiles in urbanizing regions. $100.

CARLA S. WOODWARD, Northern Michigan University. Colonization patterns and ecology of the vertebrate fauna of the Huron Islands, Lake Superior. $200.

Awards for 1974-75

RALPH A. ACKERMAN, University of Florida. The effects of nest packing and clutch size on incubation time and mortality of sea turtle eggs. $100.

JANETTE R. CUSHMAN, Colorado State University. Growth of juvenile boreal toads (Bufo boreas) in relation to temperature and ration size. $100.

JEFFREY H. DELSON and JAMES F. REYNOLDS, New Mexico State University. The population dynamics of the salamander Ambystoma tigrinum in emphermal desert ponds: A simulation model. $100.

ROBERT E. GATTEN, JR., College of Wooster, Wooster, Ohio. Thermoregulation in the crocodilian reptile, Caiman sclerops. $125.

WILLIAM H. KEEN, Kent State University. Foraging strategies and niche exploitation patterns of the Allegheny Mountain salamander, Desmognathus ochrophaeus. $125.

KIRK MILLER, Colorado State University. Clinal variation in critical thermal maximum of chorus frogs. $100.

GARY J. TORRISI, State University College, Plattsburgh, New York. The effect of urethan on calcium and phosphate excretion by Rana pipiens (leopard frog). $75.

MPM - AMAZON EXPEDITION

On 14 October a MPM sponsored research expedition left the U.S. for Iquitos, Peru in the upper Amazon River basin. The trip was funded through the James Kuehn Research Fund. Dr. Max A. Nickerson is the expedition leader. The research party includes Dr. James Dixon, Texas A & M University; Richard Spieler, Louisiana State University; Lynn Hendricks, Yakima Valley College; Phil Holzbauer, University of Wisconsin-Whitewater; MPM staffers, Robert Henderson, Janice Mahlberg, Floyd Easterman; the Sherman Ketcham's, Milwaukee County Zoo and James Kuehn, the sponsor. The group will make natural history collections, survey vertebrates for hemoparasites and fungi and utilize radio-telemetry tracking equipment to study activity patterns. Mr. Pekka Soini, a Peruvian naturalist will assist the group during their two month trip.

JAIME VILLA (Cornell University) has successfully completed 2 1/2 months of intensive field work in Nicaragua (Matagalpa) and Costa Rica (San Jose), studying the biological relationships between unhatched tadpoles of some centrolenid and hylid frogs and certain flies (Eryphidae, Drosophilidae). Two parasitic species were investigated in greater detail, and 3 others were found also associated with the frogs, but the nature of their relationship was not fully established. Additional field work is planned for the next rainy season.

The Zoological Society of San Diego is actively recruiting a Curator of Reptiles. The successful applicant should have at least a masters degree (Ph.D. preferred) with a broad knowledge of herpetology and some practical experience in maintaining a herpetological collection. Salary range is $13,836 to $16,800 plus fringe benefits. Send resume to: Clayton G. Swanson, Personnel Director, San Diego Zoological Garden, P.O. Box 551, San Diego, CA 92112.

John B. Funderburg, formerly Chairman, Biology Department, Randolph-Macon College, Ashland, Virginia, has been appointed Director of the North State Museum of Natural History, Raleigh. Dr. Funderburg is conducting research into the distribution and ecology of southeastern herpetozoa, especially hylid frogs. He has appointed John E. Cooper, formerly Associate Professor of Biology, Community College of Baltimore, to the post of Director of Research and Collections at the Museum, and Cooper is continuing his research on southeastern herpetology and on cave-associated vertebrates. Alvin Braswell, who has been curating the museum at the Highlands Biological Station, Highlands, North Carolina, has assumed the position of Curator I (Herpetology) at the State Museum. Braswell is investigating variation in Elaphe obsoleta in North Carolina and assisting William Palmer, Curator of Lower Vertebrates, in southeastern herpetological studies. Palmer is completing a book on the amphibians and reptiles of North Carolina, with illustrations by staff illustrator Reynaldo Kuhler.

CURRENT LITERATURE

As of July 1974, 59 searchers are scanning a total of 408 journals.
Searchers: As the titles will be published 4 times per year, try to send your titles in at least 4 times a year to have an approximately equal listing each issue in HR.

Due to lack of space in this issue, an updated list of journals is not included. Such an updated list is scheduled for next issue, budget permitting.

Any questions, comments, etc. should be sent to:

::Loveridge
REPTILES (and Amphibians) OF THE PACIFIC

271 pages, 7 plates, 1 double-page map, index (originally published in 1946 by Macmillan Company, New York)

THIS BOOK treats the herpetofauna of a vast region including Indonesia, the Philippines and Japan, Australia, New Guinea and New Zealand, and an enormous array of islands including Hawaii and the Galápagos. With such isolated land masses, the fauna is predictably diverse and includes the tuatara, several crocodiles, various lizards including the Komodo dragon, flying lizards and the Galápagos iguanas, numerous pythons, the king cobra and other poisonous elapids and vipers, the wide-ranging marine turtles and sea snakes, caecilians, the giant salamander, and many frogs and toads.

Authoritative yet written in a clear and untechnical manner, this book is the standard reference on the Pacific herpetofauna and is equally useful to professionals and amateurs. Each species is described and its range noted, together with a discussion of its life history and remarks on capture, captive specimens, reproductive habits, and use as food. There are identification keys to families and species, illustrated with seven diagnostic plates. Finally, there are chapters on snake bite and its treatment, economic aspects and conservation, collecting techniques, procedures for shipping living and preserved specimens, and an annotated bibliography.

Mr. Loveridge, now retired, was formerly curator of herpetology at Harvard University, and is a noted authority on the amphibians and reptiles of Africa and the South Pacific.

SSAR members *before publication:* $10 paperbound, $12 clothbound
Institutions and non-members: $15 paperbound, $17 clothbound

to order

Orders may be placed now. This book will be published in fall 1974; to take advantage of special prices, SSAR members must place their orders before publication. Please circle edition desired and send with payment to Dr. Henri C. Seibert, Mortor Hall, Ohio University, Athens, Ohio 45701, U.S.A. Make checks payable to: "SSAR." Receipt sent on request only.

Please mark these boxes if you want information on SSAR membership ☐ or a complete list of Society publications ☐. Publications issued by the Society include the *Journal of Herpetology, Facsimile Reprints in Herpetology, Herpetological Review, Herpetological Circulars, Catalogue of American Amphibians and Reptiles,* and the several series published by SSAR's predecessor, The Ohio Herpetological Society.

SQUEEZE BOX TECHNIQUE FOR MEASURING SNAKES

Several techniques for measuring the length of live snakes have been described (Fitch, 1960; Campbell, 1973), but we feel that these techniques are either inaccurate, stressful to the snakes, or dangerous when measuring venomous snakes. The squeeze box technique for measuring snakes was developed from an effort to solve these problems. A rectangular box was constructed from 1/2 inch (1.27 cm) plywood 20x50x20 cm with an open top. The inside bottom of the box was covered with an inch (2.54 cm) foamed rubber pad (Fig. 1).

To measure a snake by the squeeze box technique, it is placed into the box and gently but firmly pressed against the foamed rubber pad with a piece of 1/8 inch (.3175 cm) thick plexiglass having the same length and width as the inside of the box. A line is then drawn on the plexiglass, with a hydromarker, from the tip of the snake's snout down its vertebral line to the tip of its tail. A dacron string is placed along the line on the plexiglass, marked for length, and laid along a ruler to determine the length of the snake.

A hydromarker is used because the line drawn by this marker is easily washed from the plexiglass with water. Dacron string is used because it does not stretch appreciably. A map measurer was not used to measure the length of the line drawn on the plexiglass because none could be found that was graduated in millimeters.

To determine the statistical reliability of the squeeze box technique for measuring snakes, a juvenile Cyclagras gigas was measured fifty times in succession. The length measurements varied from 340 to 348 mm with a mean of 344.9 (± 1.66SD; ± 0.24SE). The confidence limits for 95% of the means of similar samples were between 344.40 and 345.36 mm.

Acknowledgements

We are grateful to Donna Campbell for the illustration and to Dr. William F. Pyburn and Jonathan A. Campbell for commenting on the original manuscript. Appreciation is also extended to the Fort Worth Zoological Park for an opportunity to develop this snake measuring technique.

THE INSTITUTO CLODOMIRO PICADO

Jaime Villa

Perhaps because of its political stability and emphasis on education, Costa Rica has distinguished itself as the Central American Republic where most of the active biological research takes place, and it is usually performed by native investigators. Just how much of this has been due to the influence of the late Dr. Clodomiro Picado, the Costa Rican naturalist, is hard to say, although not in the institute which bears his name. Last summer, those attending the ASIH-Costa Rica meetings, had the opportunity to enjoy the meetings in a benign (but genuine) tropical atmosphere, and also visit the Instituto Clodomiro Picado in the village of Coronado, near the San Jose. We inspected its facilities and chatted with its staff and students. Many of the contributors to the symposium on "Fish, Amphibian and Reptile Poisons" had done their research at the Instituto.

The Instituto Clodomiro Picado is part of the Universidad de Costa Rica , and is directed by Dr. Roger Bolanos (Ph.D., Tulane), who is also professor of immunology at the University. Most of his staff and students are joint appointees, and the institute is a likely place to do thesis research and other laboratory studies dealing with herps and their venoms.

The institute's physical facilities comprise three buildings with a serpentarium, research, production and quality-control labs and stables. As with the Instituto Butantan of Brazil, a great deal of emphasis is placed on the production of snake antivenin. The antisera thus far manufactured include a polyvalent for Central and South American forms of Bothrops, Crotalus and Lachesis, produced for both human and veterinary purposes (the latter a larger, 40 ml dose). In addition, elapid antisera are available. The bite of the large, black-and-red Micrurus mipartitus can now be neutralized by a specific antiserum produced by the institute. Also available now is a generalized coral snake antiserum, effective against most other Central American Micrurus. The production of sea snake (Pelamis) antiserum is presently being studied.

Active research is done by teamwork led by a principal investigator, often a graduate or undergraduate student at the University. The institute's director, Dr. Bolanos, is working on immunological and immunochemical aspects of coral and sea snake venom. Lic. Richard Taylor (no relation!), is studying the cytosystematic aspects of Costa Rican Micrurus and Bothrops, especially B. asper and B. atrox.

Dr. Luis Cerdas is studying the natural immunity of the mussurana, Clelia clelia, to elapid and crotalid venoms. Edgardo Moreno is investigating the blood parasites of local snakes and Srita. Olga Arroyo is doing research on aerobic and anaerobic bacteria found in snake venoms. It is Dr. Bolanos' intention that the institute would provide research facilities for visiting scientists.

An important facet of the institute's work is the educational assistance provided to Costa Rican schools and other visitors; talks on snakes and snakebite are regularly scheduled, and a variety of displays and exhibits (such as snake skins and live snakes) are open to the public.

Although herpetologists are familiar with the name of Clodomiro Picado mostly through his many books and papers on Costa Rican poisonous snakes and by patronyms such as Bothrops picadoi (among many others), his works on hematology, immunology and parasitology, not to mention his classic study on the bromeliads as an entirely new habitat, then unknown and unexpected, are only part of the legacy of his naturalist genius. The Instituto Clodomiro Picado is a fitting tribute to his memory, and one he would certainly be proud of.

NOTES ON A BROOD OF COLUBER CONSTRICTOR HELVIGULARIS AUFFENBERG

Since the 1955 description of Coluber constrictor helvigularis by Walter Auffenberg, no formal description of the young of this subspecies has appeared. It is the purpose of this paper to describe the young of this subspecies of racer.

On 21 May 1973 while on a field trip in the Apalachicola drainage system in the Florida panhandle, an adult female Coluber c. helvigularis was caught crossing a paved road five miles south of the city of Bristol, Liberty Co., Florida. The specimen measured 1280mm in total length (part of tail missing).

The specimen deposited fifteen non-adherent eggs on 25 May 1973. The eggs are typical Coluber eggs in having the noticeably grainy texture, as stated by Conant (1942). The egg laying process took approximately 1.5 hours.

The eggs were incubated in a manner similar to that used by Zweifel (1961). They were kept at room temperature (24-27°C) in a small clear plastic box that was lined with moist paper toweling. The box was exposed to fluorescent light sixteen hours per day to retard mold growth. On 29 July, after an incubation period of 65 days, the eggs began to hatch. Two eggs hatched 29 July, six hatched 30 July, and six hatched 31 July; the remaining egg was opened and found to contain a normal embryo. Each egg was slit at least twice during the hatching process. The juvenile snakes remained in the egg cases from 4 to 30 hours after having made the first slit. All measurements were taken within 24 hours of hatching. The fifteen specimens are now in the collection of the University of Michigan Museum of Zoology number 132888.

The ground color of the young brown-chinned racers is light gray anteriorly, gradually fading to grayish-brown on the posterior one-third of the body and tail. The dorsal blotches are maroon with dark brown borders, these gradually fade and diminish in size becoming partially obscured on the posterior one-third of the body. The ventral coloration is white on the chin and throat, gradually darkening to light gray near the anus. The underside of the tail is pinkish-gray and is noticeably lighter in coloration than the posterior one-third of the body. The lateral spots are dark brown in color and are randomly scattered between the dorsal blotches. The ventral spots are maroon and number from 2-6 per scute; these gradually fade and are absent on the posterior one-third of the body. The eye color of newly hatched helvigularis is reddish-brown. One feature that is constant in the specimens at hand is the almost complete delineation of the second lower labial scale with small brown pigment spots.

Specimens ranged from 260-340 mm in total length with snout-vent length from 187-241 mm. Tail length as a percentage of total length ranged from 23.5-29.5% with the mean for five males being 27.1% and for nine females 27.2%. All specimens have 17-17-15 scale rows. All specimens have 7+7 upper labials and thirteen have 8+8 lower labials;one male has 9+8 lower labials and one female has 8+9 lower labials. The ventrals ranged from 168-178 (mean 173.8) in six males and 173-180 (mean 177.6) in nine females. The caudals ranged from 112-144 (mean 112.6) in five males and 104-115 (mean 108.7) in nine females. Twelve specimens have 2+2 postoculars, two have 2+3 and one has 3+3 postoculars.

I am grateful to Dr. Sherman A. Minton, Jr. for technical assistance given in the preparation of this paper.

BOOK REVIEW

John Goode, "Turtles, Tortoises, and Terrapins". (Illus. Alex Bailey). NY: Scribner's, 1971. 63 pp.

"Turtles, Tortoises, and Terrapins" is an elementary introduction into the natural history of turtles. John Goode's journalistic background shows in the clearly written and easily readable text. Similarly his facts are accurate and not distorted by simplistic generalities. Since the book is directed towards an Australian elementary and junior high school audience, many of his examples are drawn from the small Australian turtle fauna; because of this it has somewhat limited use to a general American audience of that level. However, an avid turtle collector will enjoy and learn from this book.

Its content is divided into nine chapters. The first three chapters describe the major groups of turtles, the structure of the shell, special protective and food getting adaptations, and turtle reproduction. The next two chapters deal with sideneck turtles followed by one chapter each on tortoises and sea turtles. Book concludes with two chapters dealing with turtles' interaction with man. A glossary and index are present.

George Zug
National Museum of Natural History

Kansas Herpetological Society

A new herpetological society was recently organized in Lawrence, Kansas. Anyone interested in becoming a member is requested to apply to: Ms. Mary Dawson, KHS Treasurer, Topeka Zoological Park, 635 Gage Boulevard, Topeka, Kansas 66606. Dues are $3.00 and checks can be made payable to "Kansas Herpetological Society".

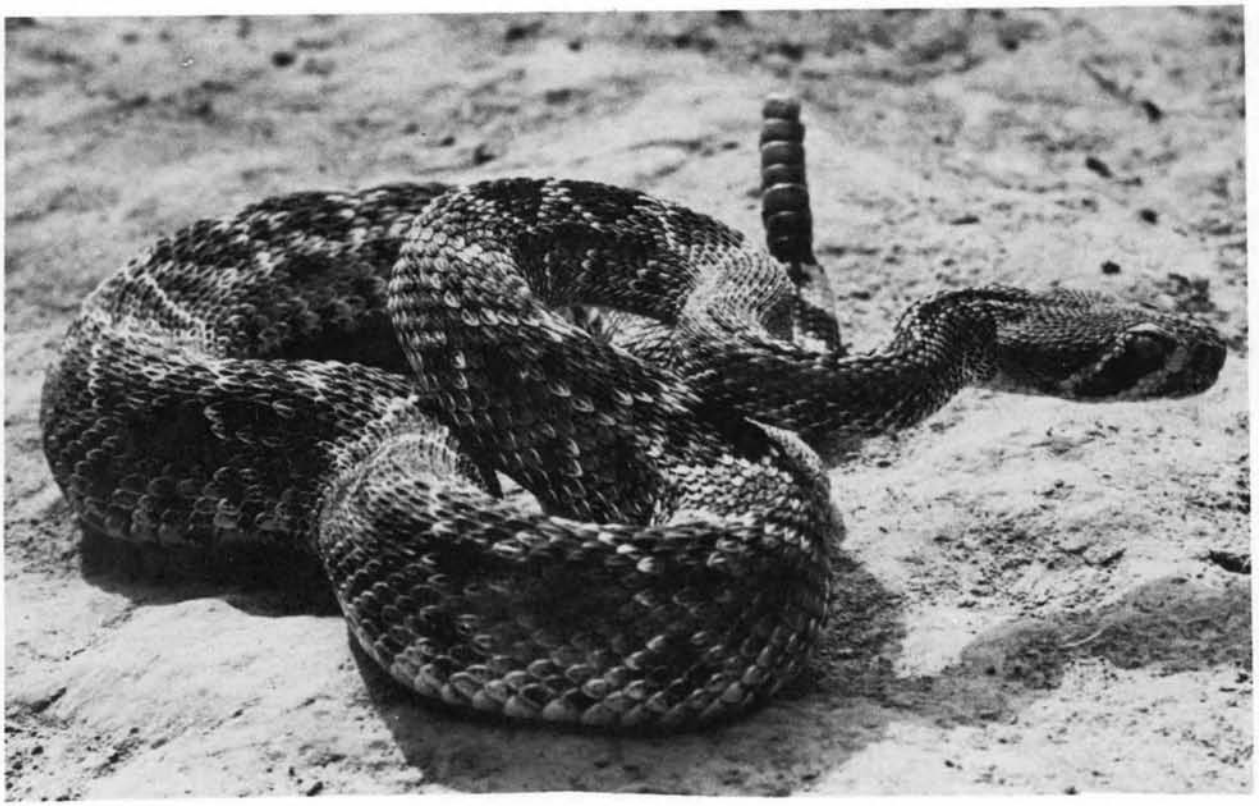
Albino Toad Found in Michigan

A four-year old boy in Warren, Michigan found an albino toad which is causing excitement among researchers at the University of Michigan Amphibian Facility. The transparent skin of the albino will allow scientists to observe the animal's bodily functions. (Milwaukee Journal, 10 June 1974).

SEA SNAKES KILL SWIMMERS



Dozens of swimmers and fishermen have been killed by sea snakes recently off the tourist beach at Vung Tan, 70 miles northeast of Saigon on the China Sea. Sources say the snakes, usually found 90-180 miles northeast of Saigon, have been moving south looking for food in recent years. (Agence France- Presse dispatch in The Milwaukee Journal)

RECENT DEATHS

Glenn Gentry, 78; retired chief of fish management, Tennessee Game & Fish Commission, died 15 December. He was the author of publications concerning Tennessee's herpetofauna and an active member of SSAR Conservation Committee until 1973.

- - - - - - - - - - - - - - - - -

A. E. McDaniel, 43; Curator of Reptiles, Max Allen's Zoological Gardens, Eldon, Missouri, died 5 May in a truck-bicycle accident. He was the author of two herpetological notes and often assisted scientists obtain specimens or data. Mr. McDaniel had survived the bite of a black mamba (Dendroaspis polylepis) in 1965.

AMERICAN ASSOCIATION OF ZOOS, PARKS AND AQUARIUMS CENTRAL REGIONAL CONFERENCE: EMPHASIS HERPETOLOGY

The AAZPA Central Regional Conference was held in Arlington, Texas on April 7-11. The meeting began by introducing the special guest and recipient of the AAZPA Presidents Award to Dr. Edward H. Taylor, Professor Emeritus, Kansas University. The award was given to Dr. Taylor in view of his long list of accomplishments in the field of herpetology and identified him as one of the early "fathers of modern herpetology". A major part of the program centered around herpetology in zoos and on the natural history of various species in the wild. Topping off the program was a superb paper on the feeding behavior in Varanus komodensis by Dr. Walter Auffenberg, Florida State Museum.

Two other events of the meeting were important to the field of herpetology. First, Dr. Earl Baysinger, Office of Endangered Species, Washington, talked about and answered questions concerning the recent laws and pending legislation that will affect the importation and transportation of animal species across state lines and possession of various animals. The Lacey Act, Endangered Species Act of 1973,and an International Treaty were among the topics of great concern. After attending this meeting and doing some investigations into the situation, I feel that the SSAR should invite Dr. Baysinger to the Auburn meeting to talk with us how these laws will affect the work of herpetologists in the U.S. and abroad.

The final area of concern to SSAR members was covered in speeches given by Wayne Seibert, Dallas Museum and me, on the cooperation between zoos, museums and other professional herpetologists. The present lack of funding for research both in museums and universities will be coupled with increased restrictions on importing animals. The time seems right for increased cooperation to fully utilize any animal taken from the wild for research and public education purposes.

REPTILE-AMPHIBIAN LONGEVITY SURVEY

J. Kevin Bowler, Curator of Reptiles at the Philadelphia Zoological Garden, is continuing and expanding the work on reptile and amphibian longevity begun by the late Charles E. Shaw and by Carl Kauffeld. Mr. Bowler requests that supervisors of institutional and private collections write to him for survey record sheets. All responding collections will receive a summary of the survey and appropriate credits in any publication of the data. Write to Mr. Bowler at the Philadelphia Zoological Garden, 34th Street and Girard Ave., Philadelphia, Pa. 19104.

NEWS NOTES FROM SWANEWS, 1974 (1 & 2)

****

Kenneth Williams (Northwestern State University, Nachitoches, Louisiana) has initiated work on the snake genus Apostolepis and is continuing work on a semi-popular book, "Living Snakes of the World" for T. F. H. Publications.

* * * * * * * * * * * * * * * *

Victor Hutchison, Howard Haines, Gus Engbretson, and Don Howard of the University of Oklahoma are studying the physiological ecology of telmatobatid frogs on Lake Titicaca in the high Andes of Peru.

* * * * * * * * * * * * * * * *

Larry G. Michel and Michael E. Newlin (Angelo State University) are studying aspects of the ecology of Urosaurus ornatus and Sceloporus scalaris, respectively, and Marsha White is studying the herpetofauna of Mason County, Texas.

* * * * * * * * * * * * * * * *

John W. Ferner (Univ. of Colorado) is studying a population of Uma exsul in northern Mexico.

INDIVIDUALS & INSTITUTIONS

UNIVERSITY OF KANSAS: William E. Duellman, Linda Trueb, and John E. Simmons will be traveling through western South America from May 1974 to August 1975. Research projects on the evolution of egg-brooding frogs and ecology and biogeography of the Andean herpetofauna are supported by grants from the National Science Foundation and National Geographic Society, respectively. During their absence from the Museum of Natural History, the herpetological collections will be supervised by Alan H. Savitzky and Joseph T. Collins.

Martha L. Crump completed her Ph.D. dissertation "Reproductive strategies in a tropical anuran community". Beginning in August 1974 she will have a post-doctoral research position at the Department of Biology, Brooklyn College, CUNY.

Stephen R. Edwards completed his Ph.D. dissertation "A phenetic analysis of the genus Colostethus (Anura:Dendrobatidae)". He will continue as Administrative Officer of the Association of Systematic Collections at the University of Kansas.

Effective 1 July 1974 Richard Wassersug will be an Assistant Professor, Department of Anatomy, University of Chicago.

PENNSYLVANIA PROTECTS THE BOG TURTLE. With the passage of House Bill 1248, by the General Assembly, Pennsylvania has joined other states in providing legal protection for the Bog Turtle (Clemmys muhlenbergi). The new law, which amends Section 300 of the Fish Law of 1959 relating to frogs, tadpoles and turtles, provides a stiff penalty. The amendment makes it unlawful "to catch, take, kill, have in possession, sell, or offer for sale or purchase, without permit from the Director of the Pennsylvania Fish Commission, any bog turtle (Clemmys muhlenbergi)." Each turtle constitutes a separate offense, and the law provides that any Bog Turtle caught by mistake is to be released immediately in the condition in which it was taken. The amended law specifies a fine of $500, upon conviction.

The Pennsylvania Bog Turtle law is designed to stop further drains on depleted populations in Pennsylvania and in other states. The prohibition of sale of Bog Turtles is aimed directly at unscrupulous dealers who have helped to maintain the demand for Bog Turtles as pets. The fine of $500 was set high enough to offset any possible profit from sales of Bog Turtles.

Passage of the law has resulted in newspaper publicity for the plight of the Bog Turtle, and public interest in its preservation. Following the lead of the Pennsylvania Fish Commission, which initiated and supported the Bog Turtle law, conservation agencies in Pennsylvania are making plans to protect some of the remaining populations and habitats. C. J. McCoy, Carnegie Museum of Natural History, Pittsburgh, PA 15213.

BOUNTY ON RATTLESNAKES IN NEW YORK

It has come to our attention that a bounty on the Timber Rattlesnake (Crotalus h. horridus) is about to be reinstated in upper Warren and Washington Counties (Lake George region). The bill has already passed the State Assembly 100-15 and is now on the State Senate Floor. It should be pointed out that the bounty, $5.00 per head, is pushed by the area's hotel and resort owners. The State Conservation Department is not in favor of the bill for the simple reason that a bounty is not a solution to any type of Wildlife management. Most of the snakes taken in previous years (1969-1971) were taken from unpopulated areas by professional hunters.

If you live in New York, we urge you to write at once to your local State Senator, with a copy to Senator Bernard Smith, Chairman, Committee on Conservation & Recreation, Senate Chambers, Albany, New York 12224.

If you are out of State write to Senator Smith in reference to Assembly Bill A-8711. (From N.Y. Herp. Soc. Newsletter)

EFFORTS TO SAVE THE BOG TURTLE

John L. Behler, Dept. of Herpetology, Bronx Zoological Park, "has received authorization from the New York State Dept. of Environmental Conservation to conduct a statewide survey and inventory on the Bog Turtle (Clemmys muhlenbergi)." (From N.Y. Herp. Soc. Newsletter).

CONSERVATION NOTES

* *

"Recent studies by Dan W. Speake and Robert H. Mount indicate that the use of gasoline fumes or gasoline itself to drive herps out of gopher tortoise burrows is ecologically unwise and may kill or injure snakes and other inhabitants of the gopher-burrow "niche". Four of six rattlesnakes in burrows so treated were killed or inactivated and four of five indigo and pine snakes, driven from burrows, died within 24 days.

The Conservation Committee strongly recommends that this method of snake capture be discontinued by all SSAR members. Further studies on the effect of the technique on invertebrate and other inhabitants of the burrows appear desirable."

(Reference: Speake & Mount, 1973. Quart. Prog. Rept. Alabama Coop. Wildl. Res. Unit, 38(4):19-20.)

According to the Office of the Governor of the Commonwealth of Puerto Rico "recent studies have determined not to build the proposed superport neither in Mona nor in Monito Island." (From a letter to Kraig Adler from Luis Montalvo Cardona, Special Aide to the Governor of Puerto Rico).

- -

Turtles May Save Culebra

Because of the Endangered Species status of nesting marine turtles on Culebra Island off the east coast of Puerto Rico, the U.S. Navy may have to abandon use of Culebra for target practice. Legal counsel for Puerto Rico said there were no federal laws to protect the people of Puerto Rico from Navy shelling, but that there is a law to protect the endangered species. (From a Washington Post Service dispatch in The Milwaukee Journal, 24 May 1974).

THE KENTUCKY HERPETOLOGICAL SOCIETY

COMING 1974 MEETINGS

Meeting Place: Education Room, Louisville Zoological Gardens

Meeting Time: 5:30 p.m.

July 21: Program by
Dr. Sherman A. Minton, Jr.
Indiana University School of Medicine
Indianapolis, Indiana

August 18: Joseph T. (Tom) Collins
University of Kansas
Museum of Natural History

September 15: Program by
Dr. Burt Monroe
Department of Biology
University of Louisville

* *

PLEASE, SOMEONE, PUT A HEX ON MY VEX

A toad, is a toad, is a toad
I think when meeting one on the road,
But my friend the herpetologist
Can't resist playing the humorist.

Bufonidae!, he shouts in glee
While we more sober fellows flee.
Bufo a. americanus, --- warty
He stands there petting it, the smarty!

People I know, on every level
Flee like the wind, cuss like the devil,
Our meeting the kindliest of snakes
Provokes the shakiest of shakes.

Yet armed with just his crooked cudgel
He mucks about in every puddle,
No stone unturned from Minn. to Floridus
Poking around for Crotalus horridus.

I pray that this quaking of my knees
In my afterlife somehow will cease,
And strength be granted me, I sigh,
Just once, to look one in the eye!

Leo Johnson - MPM

MIDDLE AMERICAN RESEARCH

William J. Mautz, a doctoral student of Cornell University's F. Harvey Pough, will be spending his second field season (July-August 1974) in the Mexican States of Queretaro and Guerrero. Mautz is studying habitat selection and evaporative water loss in the xantusiids Lepidophyma gaigei and L. flavimaculatum.

CHECKLIST OF THE HERPETOFAUNA OF BELIZE

Robert W. Henderson, Milwaukee Public Museum and Leo G. Hoevers, Belize are compiling a checklist of the amphibians and reptiles of Belize (formerly British Honduras). They would appreciate being notified of any research being conducted in Belize, or with Belize material. Also, any institutions or individuals having specimens from Belize, and not already contacted, please notify R. W. Henderson, Vertebrate Division, Milwaukee Public Museum, Milwaukee, Wisconsin 53233.

CARIBBEAN FIELD STUDY TOUR

The University of California-Los Angeles Extension has arranged a two-week summer field study trip July 18 - August 1, with 3 units credit, designed to introduce biology students and serious amateur naturalists to the exciting spectacle of island evolution. The group will visit the oceanic islands of Puerto Rico and St. Vincent and the "continental" island of Trinidad. The tour will be under the guidance of Drs. George C. Gorman and Catherine Engel. Interested persons should write to: Dept. of Biological and Physical Sciences, University Extension, 6115 Math-Science Building, Univ. of California, Los Angeles, CA 90024.

GEOGRAPHIC DISTRIBUTION

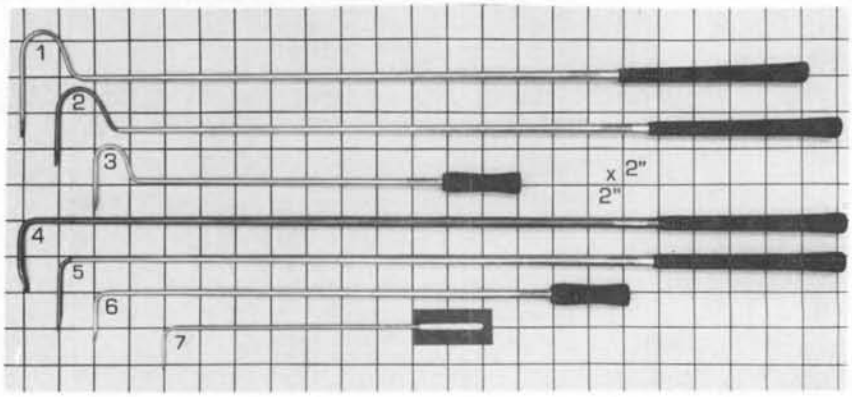
HERPETOLOGICAL REVIEW publishes brief notices of new geographical records in order to make them available to workers in published form. The STANDARD FORMAT for a record is:

SCIENTIFIC NAME (Common name). Locality (air-line distance to nearest town); date; collector. Identified or verified by. Place of deposition and catalogue number. Comments. SUBMITTED BY. address.

Please submit new records in STANDARD FORMAT (short manuscripts are acceptable when data cannot be adequately presented in standard format) to George R. Zug, Division of Amphibians and Reptiles, National Museum of Natural History, Washington, DC 20560.

Recommended citation: Jones, J. 1974. Geographic Distribution: Rana pipiens. Herpt. Rev. 5(1):1.

SERPENTES



PITUOPHIS MELANOLEUCUS SAYI (Bull Snake). U.S.A., Missouri, St. Clair Co., 2.0 km NE of Lowry City, (R25W, T39N, Section 8); 5 May 1974, Robert Krager. Robert Krager and M. A. Nickerson. Milwaukee Public Museum Herpetological Collection, MPM 7470. First record for the county and a marginal Ozark record. Submitted by Max A. Nickerson.

TROPIDOCLONION LINEATUM LINEATUM (Northern lined snake). U.S.A., Missouri, Miller Co., 4.5 km S of Eldon, (T41N, R15W, Section 22); 20 June 1973, A. E. McDaniel. M. A. Nickerson. Lost by Ozark Airlines. First record S of the Missouri River in central Missouri. Submitted by Max A.Nickerson, Milwaukee Public Museum, Milwaukee, Wisconsin 53233.

FURMONT REPTILE HOOKS
1212 W. FLAMINGO - SEABROOK, TX. 77586

FURMONT REPTILE HOOKS are the results of more than two years of field and zoo testing. They are the finest available and are presently used by more than eight nationally recognized zoos. Other sizes and designs are available - write for a complete catalog.

NOTE: Item #4, "The Stump Ripper" is an extra heavy duty field hook. The special C-Offset Tip lies flat on the ground when held by a right handed person so the hook can be used for reptile capture as well as for stump ripping, board fliping, and rock pulling in the same manner as a potato rake but it weighs 1/4 as much. A left handed version is available.

Copyright© FurMont Reptile Hooks 1972

HOW TO ORDER

1. Specify model number.
2. List options if desired.
3. Add or deduct amount indicated for each option from base price.
4. Make your check or money order payable to FURMONT REPTILE HOOKS. Prices are postpaid in the U.S.A. Texas residents add 5% Sales Tax.
5. Mail your order to FURMONT REPTILE HOOKS 1212 W. Flamingo - Seabrook, Texas 77586.

ANNOUNCES THE REPRINT EDITION OF

FAUNA OF BRITISH INDIA - REPTILIA AND AMPHIBIA

VOL. 1 LORICATA, TESTUDINES & VOL. 2 SAURIA

VOL. 1 FAUNA OF BRITISH INDIA - REPTILIA and AMPHIBIA - Loricata
Testudines, By Malcolm A. Smith (1931) (Reprinted 1973)
P.p. i-xxvii, 1-185, 2 plates, map, 42 text figs.
I.S.B.N. 0-88359-005-0

Cuora amboinensis.

COVERS THE CROCODILES, TURTLES AND TORTOISES OF SOUTHERN ASIA FROM WHAT IS NOW WEST PAKISTAN TO VIET-NAM, ON TO HONG KONG AND INCLUDING CEYLON AND TAIWAN. TOTAL OF 217 PAGES WITH 55 ILLUS. CONTAINS 2 PAGES OF PLATES OF TURTLE HEADS, LINE DRAWINGS, KEYS FOR IDENTIFICATION, ACCOUNTS OF HABITS, GLOSSARY OF TECHNICAL TERMS, INDEX AND DESCRIPTION OF THE GEOGRAPHICAL AREAS. THIS VOLUME ALSO CONTAINS AN ELEVEN PAGE HISTORY OF THE HERPETOLOGICAL RESEARCH IN THE INDIAN-INDO-CHINA AREAS, WITH BIOGRAPHICAL SKETCHES OF 33 OF THE EARLIER RESEARCHERS. VOL. 1 (PURCHASED SEPARATELY)..... $15.00

VOL. 2 FAUNA OF BRITISH INDIA - REPTILIA and AMPHIBIA - Sauria
By Malcolm S. Smith (1935) (Reprinted 1973)
P.p. i-ix, 1-440, 2 maps, 1 plate, 94 text figures.

Phelsuma andamanense.

COVERS THE LIZARDS OF THE SOUTHERN ASIA AREA AS VOL. 1. TOTAL OF 445 PAGES WITH 107 ILLUSTRATIONS, INCLUDING 1 PAGE OF PLATES. CONTAINS KEYS FOR IDENTIFICATION, ACCOUNTS OF HABITS, DESCRIPTIONS, RANGES, GLOSSARY, INDEX, MAP OF THE AREA, AND BIBLIOGRAPHY.
VOL. 2 (PURCHASED SEPARATELY).....$22.50

PRICE FOR THE SET - VOLS. 1 & 2.....$35.00

ANNOUNCEMENT

Milwaukee Public Museum has established three new publication series which publish herpetological manuscripts. Current publications available are:

SPECIAL PUBLICATIONS IN BIOLOGY AND GEOLOGY

No. 1 The State Laws Regulating the Collecting of Reptiles and Amphibians in the Fifty United States, Adrian F. Czajka and Max A. Nickerson, vii + 79 pp., 1974..... $ 1.75

PUBLICATIONS IN BIOLOGY AND GEOLOGY

No. 1 The Hellbenders: North American Giant Salamanders, Max A. Nickerson and Charles E. Mays, viii + 106 pp., 26 fig., one color plate, 10 tables, 1973..... $ 4.25

CONTRIBUTIONS IN BIOLOGY AND GEOLOGY

No. 1 Resource Partitioning Among the Snakes of the University of Kansas Natural History Reservation: A Preliminary Analysis, Robert W. Henderson, 11 pp., 1974..... $ .35

No. 2 Additions to the Herpetofauna of Belize (British Honduras), Leo G. Hoevers and Robert W. Henderson, 6 pp., 1974..... $ .35

ORDER FROM: Publications Secretary

Milwaukee, WI 53233

A GUIDE TO
THE SNAKES OF UGANDA

BY

C. R. S. PITMAN
REVISED EDITION

312 pp., with 29 coloured plates, 18 plain plates and 2 maps, crown 4to, cloth bound

£10 ($25) post free
(On October 1st, 1974 the price will be raised to £12 ($29.00)

The first edition of this book was published in Uganda in 1938 and consisted of only 450 copies. It has long been rare, and in recent years the few copies that have turned up have been selling for about £60.

The author has now completely revised the text and 5 new coloured plates have been added, so that the new edition of this standard work is completely up to date. As the only comprehensive work on the snakes of any part of Africa north of the Zambezi it has an importance far beyond the confines of Uganda.

A prospectus with a specimen coloured plate will be available shortly, and the book is scheduled for publication in August 1974.

WHELDON & WESLEY LIMITED

LYTTON LODGE, CODICOTE,
HITCHIN, HERTS, SG4 8TE
ENGLAND.

This is the first listing of the current literature project. As the first goal of the project was to prepare any sort of listing for the number 2 issue of HR, the project is on schedule. Its ultimate success will be determined by the response of the individual scanners.

As of the end of May 1974, 63 persons have volunteered to scan 370 journals. The New World journals appear to be well represented; except for certain geographic areas, the Old World journal representation is weak.

The following represents the simplest possible listing; for example, multiple authored articles are listed only under the first author. The listing represents articles published on or after 1 January 1974. Some scanners sent 1973 titles, but these were not included. Information on each entry is presented as received from the scanners.

Comments on format changes that would improve the usability of the listing without significantly increasing the work load would be appreciated. Any comments, including volunteering to scan journals not now covered, should be sent to: Ron Heyer, Coordinator, Current Literature Project, Amphibians and Reptiles, Natural History Museum, Smithsonian Institution, Washington, D.C. 20560, U.S.A.

HYNOBIUS DUG OUT OF ICE

In June 1972 a Soviet geologist dug up a living Hynobius keyserlingi from alluvial deposits of the upper Quarternary period at a depth of 11 m. It survived for six months at the Institute of Zoology of the Academy of Sciences of the Ukranian SSR. On 20 December 1972 the salamander was killed and its age determined by the radiocarbon method. The results indicated the Siberian Hynobius 90 ± 15 years. This is considered a conservative estimate. (From 1971 Consultants Bureau, a division of Plenum Publishing Corp., New York, N.Y.)

HERPETOLOGICAL TECHNIQUES

HERP REVIEW publishes brief descriptions of novel herpetological techniques in order to make them available to the general herpetological community. The following format should be followed:

TITLE (The technique and the animal or group to which it applies - e.g., "Trapping Necturus" or "Marking Turtles".)

DESCRIPTION OF METHOD (As succinctly stated as possible; illustrations may be used.)

RESULTS & DISCUSSION (The technique's application might be criticized and it may be compared to other methods. Once again, brevity is at a premium.)

LITERATURE CITED (Only if compared with other methods which have been published.)

AUTHOR (Full name & address.)

If need be, submitted articles will be edited and returned for the author's approval.

Manuscripts should be sent to the section editor, Robert A. Thomas, Dept. of Wildlife and Fisheries Sciences, Texas A&M University, College Station, TX 77843.

Dr. John Minnich of UWM has been invited to present a paper at the I.U.P.S. (International Union for Physiological Scientists) Satellite Symposium on Environmental Physiology from October 11-18 in Jerusalem, Israel. His paper is titled "Water Procurement and Conservation by Desert Reptiles in their Natural Environment".

REGISTRATION FORMS
SSAR-HL MEETING
12-14 AUGUST, 1974
AUBURN UNIVERSITY

The registration fee includes cost of meeting rooms, social, coffee breaks, printing and mailing, catfish fry, etc. Pre-registration is $10.00. Registration after August 2 and at the meeting will be $12.00.

NAME _____

ADDRESS _____

_____ Zip Code _____

ARRIVING _____ (Day, Date) LEAVING _____ (Day, Date)

_____ Pre-registration fee(s) at $10.00 per person = $ _____

_____ Nights double occupancy at $4.16/night/person = $ _____

_____ Nights single occupancy at $6.24/night/person = $ _____

_____ Group photos (B&W, 8x10) at $2.00 (postage incl.) = $ _____

(Amount of enclosed check) TOTAL = $ _____

MAKE CHECKS AND MONEY ORDERS PAYABLE TO: SSAR-HL-AUBURN

MAIL THIS FORM IMMEDIATELY TO GEORGE W. FOLKERTS

- -

AIRPORT PICK-UP FORM
(Columbus, Georgia Only)

I will be arriving at Columbus on _____ (Airline) flight number _____ on _____ (Day, Date) at _____ (Time) Use time as indicated by airline. Columbus is EDT, Auburn CDT. We will compensate. Look for someone holding sign saying "SSAR-HL".

This form may be mailed with above form. If mailed separately, send to R. H. Mount.

- -

FIELD TRIP FORM

I plan to go on the (circle choice) Red Hills, Cheaha Mt. Field trip.

_____ I will be able to supply a vehicle in which, in addition to myself, I will have space for _____ riders in addition to those who already plan to ride with me.

_____ I will not have a vehicle and _____ need a ride
_____ have arranged to ride with _____ name of driver

****

CATALOGUE OF AMERICAN AMPHIBIANS AND REPTILES

(Now published by the SSAR)

****

A loose-leaf series of 2- to 4- page species accounts of the amphibians and reptiles of the Americas, with special emphasis on those in the United States and Canada. Accounts 1-150 were published from 1963 to 1972.

Binder, Taxonomic Tabs, and Accounts 1-150.

Individuals..... $25.00
INSTITUTIONS..... $35.00

Subscription for 1973 (Accounts 151-175)

Individuals..... $ 6.00
INSTITUTIONS..... $12.00

Write: HENRI C. SEIBERT, SSAR
Department of Zoology
Ohio University
Athens, OH 45701 USA

---

* * * * * * * * * * * * * * * * *

There are a few SSAR-HL PLU group photographs available at $1.50 each. Order from: Dr. Henri Seibert, Publ. Secr., Dept. of Zoology, Ohio Univ., Athens, Ohio, 45701.

* * * * * * * * * * * * * * * * * *

Wanted: Good colored slides of all subspecies of Lampropeltis triangulum for possible inclusion in a monograph. Contact Dr. Max A. Nickerson, Vertebrate Division, Milwaukee Public Museum, Milwaukee, Wisconsin 53233.

* * * * * * * * * * * * * * * * * *

SSAR catalog accounts, 151-175, are now payable! Send $6 to: Dr. Henri Seibert, Dept. of Zoology, Ohio Univ., Athens, Ohio, 45701.

TO: ALL SSAR MEMBERS AND FRIENDS

Dear Fellow Members:

I can now write as Past-Chairman! I have enjoyed immensely the privilege of serving you as Chairman of the SSAR in 1973, and I believe our society through our fine Board of Directors and Officers, has accomplished much. The future looks bright indeed! Thanks for all your support. I know you are giving and will give Jim Dixon that same kind of backing this year.

Some exciting things you can look forward to in the SSAR, are: 1) The resurrection of Herpetological Review to be issued four times per year at the same time as the Journal of Herpetology; 2) "Recent Literature in Herpetology" (to be published in each issue of Herp. Review, starting with No. 2, and which will fill much of the void left by the demise of HISS Titles); 3) "List of Common and Scientific Names of North American Amphibians and Reptiles" (to be published in our Circular Series); 4) Continued publication of both large and small facsimile reprints; and four substantial issues per year of the Journal of Herpetology.

Finally, on a personal note, I would like to recommend to each one of you that you consider the wonderful Creator of those animals we enjoy working with. For me, Jesus Christ is the hope of the past, present and future, and He is worthy of our acceptance and devotion. "But as many as received Him, to them gave He power to become the sons of God, even to them that believe on His name" (John 1:12). "All things were made by Him, and without Him was not any thing made that was made", (John 1:3).

Sincerely,

Arden H. Brame, Jr. II

Arden H. Brame, Jr. II
Past-Chairman

E D I T O R I A L

With this issue we resurrect Herpetological Review. During the past year the herpetological community has been served, "experimentally" by HISS-News Journal. Despite the valiant efforts of Dr. Dowling, the HISS staff, SSAR and the Herpetologists' League, the HISS project has not become self-supporting. We have been informed that some HISS projects will continue. However, SSAR has again initiated publication of Herpetological Review to replace HISS-News Journal. This will be published quarterly, instead of six times annually and will be received by all SSAR members. We express our gratitude to Dr. Dowling and the HISS staff for their many contributions. They have not been in vain.

THE MONTEVERDE CLOUD FOREST RESERVE

With the present rapid destruction of low and middle elevation neotropical forests, it is significant that the Tropical Science Center of San Jose, Costa Rica is making an effort to preserve a section of Cloud forest in the Cordillera de Tilaren, Puntarenas Province (Fig. 1).

The Monteverde Cloud Forest Reserve, as the area is now known, should be of special interest to herpetologists as one of the world's most colorful toads, *Bufo periglenes* Savage (Fig. 2) is known only from a few hectares of the lower montane rainforest portion of the original tract acquired for the preserve. It is the presence of this striking animal that initially called attention to the area for preservation. In addition, there are 222 recorded species of birds, including the Resplendent Quetzal, the Three-wattled Bellbird, and the Umbrella Bird. Mammals include Baird's Tapir, Collared Pecarry, Brocket Deer, four cats (including Ocelot and Puma), and three species of monkey (White-faced, Spider and Howler).

The virgin forest at Monteverde is outstanding in itself. Areas that are exposed to severe wind have taken on the appearance of elfin or dwarf woodland and trees in less exposed areas are heavily festooned with up to 100 species of epiphytic plants. Fog and constant dripping from the leaves gives the forest a grotesque and fairy-like appearance. The existing reserve now encompasses three major bioclimatic life zones, three distinct bird communities, and an undetermined number of localized, plant and animal subcommunities.

Because of the comfortable temperatures, middle elevation forest has been the most heavily exploited climatic habitat in the neotropics. The high desirability of this area for living, agriculture, and grazing has caused extensive deforestation and few large unbroken and undistrubed areas of forestland remain within the middle-elevation belt today. Only because of its relative inaccessibility and cloudiness has the Monteverde vicinity been left undisturbed. Until recently land was abundant in areas with less

wind and rain, lower down the mountain, and in other parts of the country. Now, however, attempts at clearing and working cloud forest areas have been started by spontaneous squatters. In addition, speculative land dealings are the one economic venture that is consistently successful in this region and affluent North Americans are the primary target for the "speculative squatter". The presence of flourishing farms in the vicinity is enough to convince the ignorant land buyer that the higher, lusher cloud forest land is also productive. Thus, action must be taken soon to prevent the Cordillera de Tilaren from becoming nothing but unproductive clearings.

The Monteverde area lends itself well to protection or social value uses: (1) It is too wet, cloudy, and windy to use for cultivation or pasturing; (2) The forests are important as a watershed; and (3) Given the central position of the Cordillera de Tilaren massif and several of the country's largest cities and towns, the area has tremendous potential as a common ground for recreation, rest, inspiration, tourism, and other amenities of a developed society.

Costa Rica, in general, presents a picture of stability in government and enterprise and the Monteverde area is one of the most stable and conservation-minded parts of the country. There need be little fear that efforts and funds invested in the Monteverde Reserve will be wasted. A sanctuary such as Monteverde is necessary not only for casual observance but also for educational and scientific purposes as well. The Monteverde area, because of its accessibility, English-speaking Quaker community, radio contact with San Jose, and other conveniences, should be well suited for use by all three contingents.

The Monteverde Cloud Forest Reserve is being assembled in stages through a program of purchases and cooperative land holding agreements. So far a total of 2,425 acres have been purchased and these holdings encompass the entire known range of *Bufo periglenes*, but

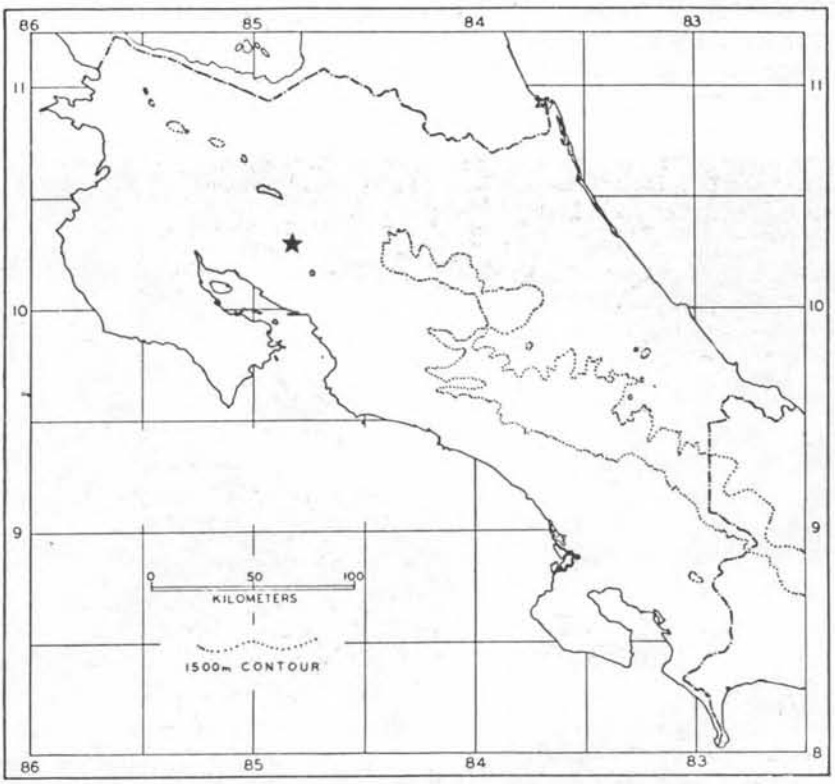

Fig. 1.--The location of the Monteverde Reserve is designated by the black star. (Map courtesy of Jay M. Savage)

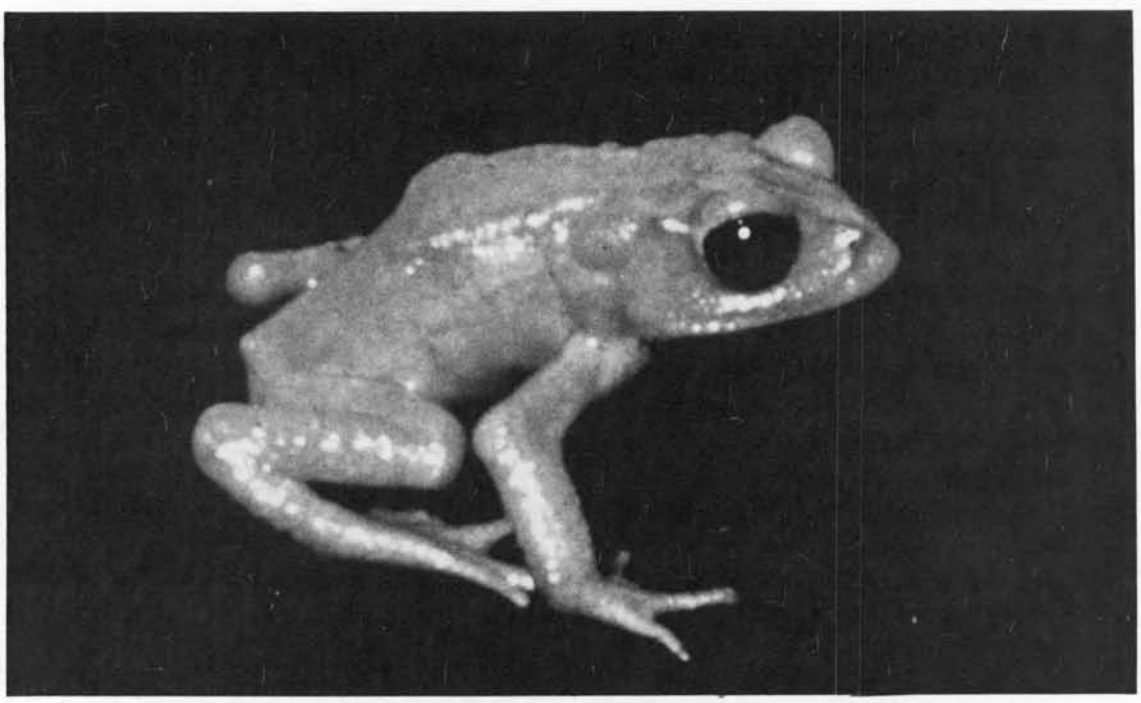


whether the size of the reserve is large enough to become self-sustaining (or an island surrounded by man's wasteland) is questionable. It is almost certain that some of the larger mammals and birds will not survive unless more of the forest is preserved. If anything meaningful is to be done to conserve a significant tract of this unspoiled forest, it must be done quickly or else short-term, short-sighted land uses practices, often stimulated by the United States' demand for great quantities of imported beef, will eliminate any possibility of preservation.

The Tropical Science Center of San Jose will serve as the recipient of donations, as well as legal guardian for the project. The Science Center is a Costa Rican organization, thus making all of its holdings tax-free. Money donated will enable the Science Center to hire guards for full-time surveillance for the reserve and to increase its land holdings.

ABSTRACTED FROM INFORMATION PROVIDED BY MONTEVERDE RESERVE COORDINATORS AND THE TROPICAL SCIENCE CENTER OF COSTA RICA.

SSAR CONSERVATION FUND

According to the Constitution and Bylaws of the SSAR (Art. II, Sec. 1) one of the Society's purposes is "To encourage conservation of wildlife in general and of amphibians and reptiles in particular." To date the Society has made no significant contributions to any organized conservation effort. Preceding is an abstract of reports provided by the coordinators of the Monteverde Cloud Forest Reserve Project. The money in the SSAR's Conservation Fund, if donated to this worthy project, would assist in the conservation of "wildlife in general" and a spectacular amphibian (*Bufo periglenes*) "in particular."

A male *Bufo periglenes* (Photo: Arden Brame).

Summary--Lacy Act Revision: Importation of Injurious Wildlife

The Department of the Interior has proposed a revision of the Lacey Act, which regulates the importation of injurious wildlife (i.e., foreign species deemed hazards to U.S.ecology, economy, or public health), which would greatly improve the regulatory authority over animal importations. In essence, this regulation will establish a list of "low risk" species which may be imported without permit. All unlisted species will require a permit for importation. These permits will be issued only where adequate facilities for secure maintenance of the species can be demonstrated or where other provisions for preventing escape and subsequent establishment can be assured--such as sterilization, importation of only specimens of like sex, etc. The intent is clearly to minimize the possibility of additional species introductions into the United States territory, not to interfere with bona fide scientific research or educational programs.

At the present time only Rana pipiens and Rana catesbeiana are included in the proposed "low risk" list of amphibians and reptiles.

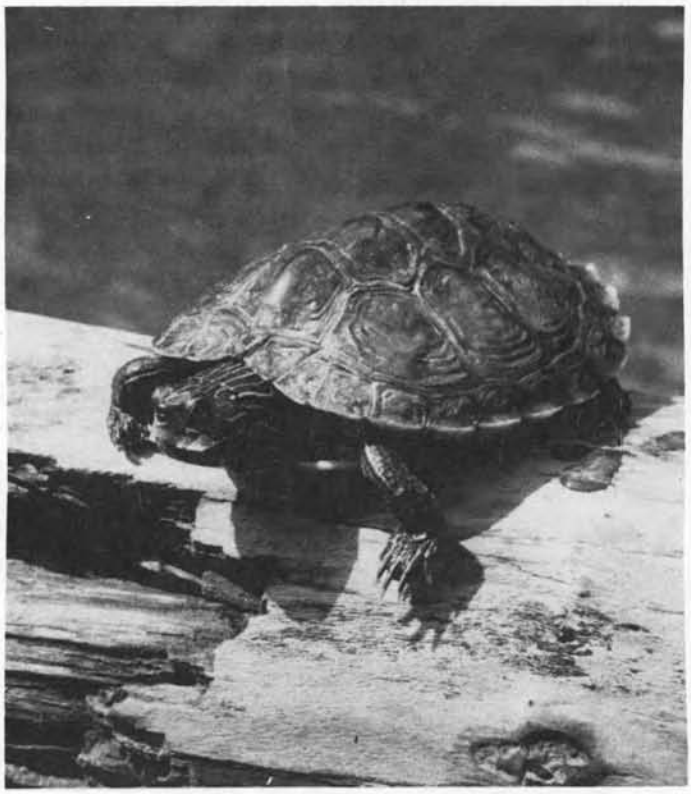
Additional information can be obtained from the Director, Bureau of Sport Fisheries and Wildlife, U.S. Department of the Interior,Washington, D.C. 20240.

CONSERVATION BRIEFS

The Animas Mts., New Mexico, have been closed to collecting by an agreement between the owner, the Bureau of Sport Fisheries, USDI, and the State of New Mexico, to protect the ridge-nosed rattlesnake (*Crotalus willardi silus*) population and the habitat in general. Serious workers with a need to work in the area can request permits from the Bureau's regional office in Albuquerque.

- - - - - - - - - - - - - - - - -

The Department of Interior has recently (December, 1973) proposed the green sea turtle (*Chelonia mydas*) and loggerhead, (*Caretta caretta*) for addition to the Endangered Species List. If these are added to the list, only the Pacific ridley (*Lepidochelys olivacea*) and flatback *Chelonia depressus* will remain unprotected. Comments on all three species should be sent to: Director, Bureau of Sport Fisheries and Wildlife, Washington, D.C. 20240.



- - - - - - - - - - - - - - - - -

Mona and Monito Islands, Puerto Rico, are seriously threatened by development for a massive superport. Mona has nine herp species, six of them endemic, including the Mona ground iguana, (*Cyclura stejnegeri*) and Mona boa, (*Epicrates monensis*). Monito is perhaps the best "birdrock" in the Caribbean. The loss of these islands would be tragic and of uncertain economic justification - it is unlikely that the port could compete with the superports planned for the mainland in Louisiana, Texas, and other Gulf states. Requests for the impact statement on this development and/or comments should be addressed to: Hon. Rafael Hernandez Colon, Governor of Puerto Rico, La Fortateza, San Juan, Puerto Rico.

Endangered Species Act of 1973

The Endangered Species Act of 1973 was recently passed by Congress and signed by President Nixon on December 28, 1973. This is a sweeping revision of the old 1969 Act and contains many new provisions. The full ramifications of this legislation will not be understood for quite awhile apparently; it will take considerable effort to develop a working set of regulations and to determine exactly how some of the definitions may be interpreted biologically.

A brief overview of this significant piece of legislation indicates points of special interest: (1) it implements the 1973 Convention on Trade in Endangered Flora and Fauna and will thus have considerable impact on commercial exploitation of herps.

A female *Graptemys geographica*, North Fork of White River, Ozark County, Missouri (Photo: Max Allen's Zoological Gardens).

commercial exploitation of herps. (2) it provides for Federal protection of U.S. endangered species if the individual States do not develop acceptable endangered species programs within 15 months--the 1969 Act did not provide for Federal protection except through habitat purchase, (3) it makes Land and Water Conservation Funds available again for purchase of these habitats, (4) it provides for a Federal Aid program to support State endangered species projects, (5) it establishes two official categories, endangered and threatened with endangerment, instead of the one endangered category of the 1969 Act (the previous "threatened" and "rare" categories of times past were just informal), (6) it expands the government's concern beyond "species" and "subspecies", taxonomically recognized, to "populations", thus raising the specter of a real biological nightmare, but allowing for the protection of biogeographically significant isolated, etc.,populations which have never been blessed with a formal name in the capricious application of taxonomic rigor, (7) it provides for a reasonable "management" approach to threatened species, instead of the rigorous protectionist approach required for truely endangered species; that is, a threatened species might still have special regulations written for it which will allow for reasonable "harvest" by scientists or, in the case of game species, hunters, while still protecting it from commercial exploitation. This allows for a more flexible approach to the whole issue of "endangered species" and points 5 and 6, in tandem, may well be the salient features of the 1973 Act from the herpetologist's viewpoints.

This Act has many other points of interest, too many to go into in detail here, and anyone wishing more information may request a copy from the Director, Bureau of Sport Fisheries and Wildlife, U.S.Department of the Interior, Washington, D.C. 20240.

CURRENT LITERATURE PROJECT

Ron Heyer, Coordinator
Amphibians and Reptiles
Natural History Museum
Smithsonian Institution
Washington, D.C. 20560

The SSAR appointed a committee to determine how current literature citations could be made available to the SSAR members consequent to the loss of HISS services. The committee, chaired by John Wright, made the following recommendation which was approved by the SSAR. The SSAR will continue to provide current literature citations to its membership through a program in which the source of literature citations will come from the herpetological community itself. In order to implement this program, three basic actions were taken.

1) The SSAR is supporting a part time secretary who prepares a photocopy listing of titles to be produced in Herpetological Review.

2) An interim coordinator for the project was appointed.

3) John Wright sent out an initial letter to 200 members asking them to voluntarily scan from 5-10 journals and send in the citations to the coordinator.

As the interim coordinator, I would like to briefly report on how the project will be run, the current status of the project, and how further help can be volunteered.

The Division of Amphibians and Reptiles of the National Museum of Natural History will be the coordinating center. Literature citation lists will be prepared based upon citations that have been sent to the coordinating center. The Division of Amphibians and Reptiles will not contribute any resources other than the coordinator's time because: 1) The idea of a volunteer program is experimental. In order to determine whether the program is successful, it should be run on its own. 2) The project has a 4 year time limit with the Division. In order for the project to be transferrable, it should not be tied to the gratuitous resources of any individual or institution. The lists, as they appear, will reflect the support of the general herpetological community, not the Division of Amphibians and Reptiles at the Smithsonian.

As of 14 February 1974 the response to John Wright's letter of 11 January 1974 was a total of 48 persons scanning a total of 253 journals. The part time secretary will scan four journals devoted to amphibians and reptiles. The first list will be printed in the next issue of Herpetological Review.

A list of the journals assigned as of 14 February is presented so that anyone who wishes to contribute to the program may do so. If you normally scan a journal or journals not listed, please write down the journals you scan, send the list to me and I will, in turn, indicate to you if they have been previously assigned. Once assigned a journal to scan, a 3 x 5 card should be sent to me for each article on amphibians and reptiles. The format is that previously used by HISS. Citations should be for articles appearing on or after 1 January 1974.

Finally, if anyone else is interested in coordinating the project, please contact me. I am interested in seeing the project be successful, but have no intrinsic interest in coordinating the project because of the kind of work involved.

NEW PUBLICATION SERIES

The Milwaukee Public Museum has announced three new publication series. The first numbers of each are herpetological in nature.

Publications in Biology and Geology

No. 1 The Hellbenders: North American "Giant Salamanders". Max Allen Nickerson and Charles Edwin Mays. In Press. 110 pp.

Contributions in Biology and Geology

No. 1 Resource partitioning among the snakes of the University of Kansas Natural History Reservation: a preliminary analysis. Robert W. Henderson.

Special Publications

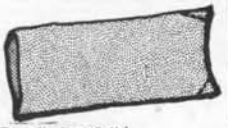
No. 1 State Regulations for Collecting Reptiles and Amphibians in the Fifty United States. In Press. ca 70 pp.

DINOSAUR EGGS?

According to UPI sources in the Milwaukee Journal (18 February 1974), fossilized dinosaur eggs may have been discovered at Chateaneuf le Rouge in southeastern France. Last August, workmen digging a gas main for a new restaurant found a nest of eggshaped, stonelike objects. They weighed an average of 15 pounds and were 7 to 9 inches in length. It is believed that dinosaurs once ranged through nearby mountains. The restaurateurs indicated that they did not plan to make omelets out of them.

PATENT PENDING **REPTILE BAG STIK**

SUP-R-BAGS

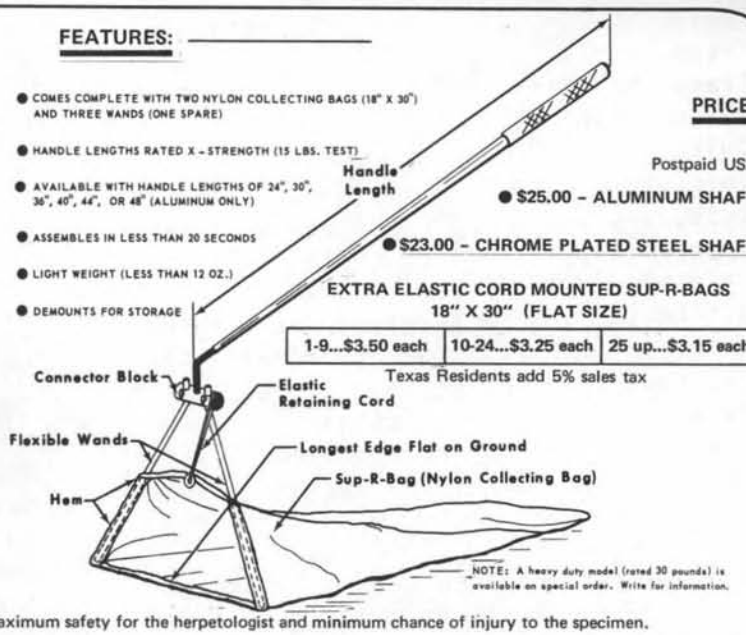


FEATURES:

- ULTRA-POROUS RIP STOP NYLON - ROTPROOF
- TRANSLUCENT—ANIMALS HEAD CAN BE SEEN
- SEWN OFF BOTTOM CORNERS TO ALLOW SAFER DUMPING OF SPECIMEN
- STRONG - SEWN WITH POLYESTER THREAD
- WADS UP TO THE SIZE OF A TENNIS BALL
- 18" X 37" FLAT SIZE - EASY TO TIE OFF

PRICE: Texas residents add 5% sales tax Postpaid USA

Reptile Collecting Bag



1 - 9 ... $3.00 each
10 - 24 ... $2.75 each
25 UP ... $2.65 each

(Not for use with Reptile Bag Stik)

FEATURES:

- COMES COMPLETE WITH TWO NYLON COLLECTING BAGS (18" X 30") AND THREE WANDS (ONE SPARE)
- HANDLE LENGTHS RATED X - STRENGTH (15 LBS. TEST)
- AVAILABLE WITH HANDLE LENGTHS OF 24", 30", 36", 40", 44", OR 48" (ALUMINUM ONLY)
- ASSEMBLES IN LESS THAN 20 SECONDS
- LIGHT WEIGHT (LESS THAN 12 OZ.)
- DEMOUNTS FOR STORAGE

PRICE:

Postpaid USA

- $25.00 - ALUMINUM SHAFT
- $23.00 - CHROME PLATED STEEL SHAFT

EXTRA ELASTIC CORD MOUNTED SUP-R-BAGS
18" X 30" (FLAT SIZE)

1-9...$3.50 each	10-24...$3.25 each	25 up...$3.15 each

Texas Residents add 5% sales tax

A unique device for the capture and/or transfer of reptiles with maximum safety for the herpetologist and minimum chance of injury to the specimen.

Flexible wands are inserted through slit holes in the hem to hold open the nylon bag. The bottom edge will lie flat on the ground or conform to an irregular surface. This allows the specimen to be chased into the bag while on the ground or picked up with a hook and dropped into the bag. The bag is then spun shut, slipped off the wands and then tied off. A new bag can then be put on the wands.

The bag opening is easily adjusted to face in any selected direction by means of a set screw. The wands are demountable and/or replaceable by means of thumb screws.

ANNOUNCES THE REPRINT EDITION OF

FAUNA OF BRITISH INDIA - REPTILIA AND AMPHIBIA

VOL. 1 LORICATA, TESTUDINES & VOL. 2 SAURIA

VOL. 1 FAUNA OF BRITISH INDIA - REPTILIA and AMPHIBIA - Loricata Testudines, By Malcolm A. Smith (1931) (Reprinted 1973)
P.p. i-xxvii, 1-185, 2 plates, map, 42 text figs.
I.S.B.N. 0-88359-005-6

Cuora amboinensis.

COVERS THE CROCODILES, TURTLES AND TORTOISES OF SOUTHERN ASIA FROM WHAT IS NOW WEST PAKISTAN TO VIET-NAM, ON TO HONG KONG AND INCLUDING CEYLON AND TAIWAN. TOTAL OF 217 PAGES WITH 55 ILLUS. CONTAINS 2 PAGES OF PLATES OF TURTLE HEADS, LINE DRAWINGS, KEYS FOR IDENTIFICATION, ACCOUNTS OF HABITS, GLOSSARY OF TECHNICAL TERMS, INDEX AND DESCRIPTION OF THE GEOGRAPHICAL AREAS. THIS VOLUME ALSO CONTAINS AN ELEVEN PAGE HISTORY OF THE HERPETOLOGICAL RESEARCH IN THE INDIAN-INDO-CHINA AREAS, WITH BIOGRAPHICAL SKETCHES OF 33 OF THE EARLIER RESEARCHERS. VOL. I (PURCHASED SEPARATELY)..... $15.00

VOL. 2 FAUNA OF BRITISH INDIA - REPTILIA and AMPHIBIA - Sauria
By Malcolm S. Smith (1935) (Reprinted 1973)
P.p. i-ix, 1-440, 2 maps, 1 plate, 94 text figures.

Phelsuma andamanense.

COVERS THE LIZARDS OF THE SOUTHERN ASIA AREA AS VOL. I. TOTAL OF 445 PAGES WITH 107 ILLUSTRATIONS, INCLUDING I PAGE OF PLATES. CONTAINS KEYS FOR IDENTIFICATION, ACCOUNTS OF HABITS, DESCRIPTIONS, RANGES, GLOSSARY, INDEX, MAP OF THE AREA, AND BIBLIOGRAPHY.
VOL. 2 (PURCHASED SEPARATELY).....$22.50

PRICE FOR THE SET - VOLS. 1 & 2.....$35.00

DISTRIBUTION RECORDS OF AMBYSTOMA LATERALE AND A. TREMBLAYI IN WISCONSIN

Jeffrey L. Briggs

The distribution of the triploid salamander Ambystoma tremblayi and its diploid relative Ambystoma laterale is not clearly defined in Wisconsin. The following collections were made in 1972 and 1973 by a number of individuals collecting throughout the state. Species designations were made by measurement of red blood cells suspended in amphibian saline. The major and minor axes were measured and cells approximately 25 by 40μ (785μ^2) were assigned to Ambystoma laterale. Cells approximately 30 by 50μ (1177μ^2) were assigned to Ambystoma tremblayi. All specimens have been deposited in the Milwaukee Public Museum (MPM) and confirmed by Max Nickerson.

AMBYSTOMA LATERALE (Blue-spotted salamander)

MPM-6664 Polk Co., Wi; Interstate Park, 2 mi S of St. Croix Falls; T34N, R19W, SW1/4 Sec. 36; Richard Vogt.

MPM-6665 Manitowoc Co., Wi; Point Beach State Forest; T20N, R24E, SW1/4 Sec. 16; 15 Nov. 1973; Richard Vogt.

MPM-6666-6674 Fond du Lac Co., Wi; SE shore of Little Mud Lake, North Kettle Moraine State Forest; T13N, R19E, NE1/4 Sec. 12; 10 Oct. 1973; Richard Vogt.

MPM-6675 Bayfield Co., Wi; Jakes Lake (S end of Pigeon Lake); 3.5 mi W of Drummond on County Hwy N; T45N, R8W, NE1/4 of NE1/4 of E1/2 of Sec. 35; 23 May 1973; T. Lukes.

MPM-6676 Ashland Co., Wi; 0.5 mi from Clam Lake turn off to Field Station; NW of village of Clam Lake; T43N, R4W, NE1/4 of SE1/4 of Sec. 30; 28 May 1973; Eddi Spangler.

MPM-6677 Bayfield Co., Wi; S side of Pigeon Lake, 3.5 mi W of Drummond, T45N, R8W, NE1/4 of NE1/4 of Sec. 35, 4 June 1973; Curtis Frye.

MPM-6678 Ashland Co., Wi; Crossing Hwy 72 2.4 mi E of junction M (village of Clam Lake); T43N, R4W, S1/2 of Sec. 34; 4 June, 1973; Joan Overgard.

MPM-6680 Bayfield Co., Wi; S side of Pigeon Lake, 3.5 mi W of Drummond. T45N, R8W, SW1/4 of Sec. 26; 21 May 1973; Mark Melius.

MPM-6681 Bayfield Co., Wi; 2100 meters S of E tip of Pigeon Lake, 3.5 mi W of Drummond; T45N, R8W, NE1/4 Sec. 35; 25 May 1973; Charles Benkendorf.

MPM-6682 Bayfield Co., Wi; 13.5 mi NE of Hayward on Hwy 77; T43N, R5W, Sec. 18; 31 June 1973; V. Aarthun.

MPM-6683 Bayfield Co., Wi; 3.6 mi S of Hwy 63 on US FS Rd. 213 out of Drummond, Wi. near Lake Owen; T44N, R7W, SW1/4 of Sec. 15; 4 June 1973; Charles Craig.

MPM-6684 Washburn Co., Wi; 50 yds from Bog 1/2 mi NE of Wayland Lake; T40N, R11W, NE1/4 of Sec. 24; 27 May 1973; John Colstad.

MPM-6685 Ashland Co., Wi; 6 mi SE of Grandview along the Morengo River; 1/3 mi E of FS Rd. 202; T44N, R5W, NE1/4 Sec. 4; 4 June 1973; Thomas Haberman.

MPM-6686 Ashland Co., Wi; 8.8 mi W of Hwy 13 on Hwy 77 out of Glidden; T43N R4W, SE1/4 Sec. 36; 24 May 1973; Dennis Menasco.

MPM-6687 Bayfield Co., Wi; 100 ft from shoreline at SE end of Pigeon Lake 3.5 mi W of Drummond; T45N, R8W, NE1/4 of NE1/4 of Sec. 35; 3 June 1973 Peter Nordgren.

MPM-6688 Ashland Co., Wi; 6.7 mi W of Hwy 13 on Hwy 77; T43N, R3W, SE1/4 of SE1/4 of Sec. 32; 24 May 1973; Mark Melius.

AMBYSTOMA TREMBLAYI (Tremblay's salamander)

MPM-6663 Price Co., Wi; Sheep Ranch Rd. in Chequamegon National Forest; T39N, R3E, SE1/4 of Sec. 34; 13 June 1973; Richard Vogt; Snout-vent length is 58.1 mm; internarial distance is 3.7 mm.

MPM-6679 (JLB-562) Ashland Co., Wi; 6 mi SE of Grandview along the Marengo River between US FS Rds. 377 and 384, T45N, R5W, SW1/4 Sec. 33; 4 June 1973; Jeffrey Briggs; Snout-vent length = 66.2 mm;internarial distance = 4.2 mm.

MPM-6689 Bayfield Co., Wi; 1.5 mi S of Hwy 63 on US FS Rd. 213 SE of Drummond; T44N, R7W, SW1/4 Sec. 3; 4 June 1973; Dennis Menasco; Snout-vent length is 63.4 mm; internarial distance is 3.6 mm.

MPM-6691 Oneida Co., Wi; 6 mi S of Three Lakes on Big Lake Loop Rd; 30 July 1972; Tom Pleyte; Snout-vent length is 63.1 mm; internarial distance is 3.8 mm.

GEOGRAPHIC DISTRIBUTION

HERPETOLOGICAL REVIEW publishes brief notices of new geographical records in order to make them available to workers in published form. The STANDARD FORMAT for a record is:

SCIENTIFIC NAME (Common name). Locality (air-line distance to nearest town); date; collector. Identified or verified by. Place of deposition and catalogue number. Comments. SUBMITTED BY. address.

Please submit new records in STANDARD FORMAT (short manuscripts are acceptable when data cannot be adequately presented in standard format) to George R. Zug, Division of Amphibians and Reptiles, National Museum of Natural History, Washington, DC 20560.

Recommended citation: Jones, J. 1974. Geographic Distribution: Rana pipiens. Herpt. Rev. 5(1):1.

NEW RECORDS

SALIENTA

RANA HECKSCHERI (River frog). U.S.A., Florida, Liberty Co., 6 miles S Bristol, Little Camel Pond; 3 September 1973; M. H. Kerr, M. J. Lodato, R. E. Herrington. Charles F. Walker. Univ. Michigan Mus. Zoo., UMMZ 132181-82, 132717. First record for county; extends Florida range west at least to the Apalachicola River. Submitted by MICHAEL J. LODATO, Middle Mississippi Valley Herpetologists, P.O. Box 2005, Evansville, IN 47714.

TESTUDINES

KINOSTERNON SONORIENSE (Sonora mud turtle). U.S.A., Arizona, Yuma Co., North Gila East Main Canal, 1 mile SW Laguna Dam (32 48'20"N - 114 29'40"W), elev. 150-160 ft.; 31 March 1962; R. S. Funk. R. S. Funk. Collection of R. S. Funk, RSF 468. Only other known localities along Lower Colorado River are two old records cited by Stebbins (1966, Field Guide Western Reptiles and Amphibians, p. 83) from Imperial Co., Calif. Submitted by RICHARD S. FUNK, Department of Biological Sciences, Southern Illinois University, Edwardsville, IL 62025.

SAURIA

ANELYTROPSIS PAPILLOSUS. Mexico, Queretaro, 2.5 mi S Conca at Ex-Hacienda San Niclaus Conca; 7-8 January 1974, S. Hayes, B. Adamcik & R. A. Thomas. R. A. Thomas. Texas Cooperative Wildlife Collection, Texas A&M Univ., TCWC 45502-04. First record in Rio Santa Maria valley and first literature record from state. Submitted by ROBERT A. THOMAS, Department of Wildlife and Fisheries Sciences,Texas A&M University, College Station, TX 77843.

OPHISAURUS ATTENUATUS LONGICAUDUS (Eastern slender glass lizard). U.S.A., Virginia, Powhatan Co., 20 mi SW Richmond; 8 October 1973; J. W. Steiner. J. C. Mitchell. Virginia Commonwealth Univ., VCU 156. Extends western edge of its Virginia range 20 miles further west. Submitted by JOSEPH C. MITCHELL, 3200 Stuart St., Richmond, VA 23221.

PHYRYNOSOMA DOUGLASSI BREVIROSTRE (Eastern short-horned lizard). U.S.A., Montana, Glacier Co., 17.2 kilometer SW Cut Bank, approximately 48° 30' N and 112° 25' W, elev. 1160 meters; 18 August 1973; J. K. Werner. J. K. Werner . Northern Michigan Univ. Mus. Zool. NMUMZ 7.1. Adult specimen, 62 mm body length. First record for Glacier County. Extends the range about 150 kilometers west of locality reported by Mosimann and Rabb (Copeia 1952(1):25). Submitted by J. KIRWIN WERNER, Department of Biology, Northern Michigan University, Marquette, MI 49855.

UMA SCOPARIA (Mojave fringe-toed lizard). U.S.A., Arizona, Yuma Co., 3.4 and 3.2 mile S junction of Arizona Hwy. 72 (by Ariz. Hwy. 95); 31 July 1965; R. S. Funk. R. S. Funk. Collection of R. S. Funk, RSF 1443-44. Yuma Co., 4 mile SE Parker; 5 August 1966; R. S.

Funk. RSF 1811-16. Yuma Co., 2 mile S junction of Ariz. Hwy. 72 (by Ariz. Hwy. 95); 5 August 1966; R. S. Funk. RSF 1817. Reported previously in Arizona from one specimen from 15 mi SE Parker (Elvin, Herpetologica (1960) 16 (1):31). Submitted by RICHARD S. FUNK.

SERPENTES

ARIZONA ELEGANS ELEGANS (Eastern glossy snake). U.S.A., Colorado,Logan Co., 5 kilometer S Sterling; 11 June 1973; R. R. Cohen. R. R. Cohen. Univ. Colorado Museum, UCM 50684. A second record for northeastern Colorado, approximately 85 kilometer WNW of Wray record (Dixon, Southw. Nat. (1959) 4:24) Submitted by ROBERT R. COHEN, Department of Biology, Metropolitan State College, Denver, CO 80204.

CHILOMENISCUS CINCTUS (Banded sand snake). Mexico, Sonora, 62.3 mile SE San Luis R. C.; 2 June 1962; J. F. Allen F. S. Funk. Collection of R. S. Funk, RSF 1066. Westernmost record for Sonora. Previous western record 40 mi NW Caborca, and nearest known locality 8 mi W Wellton, Yuma Co., Arizona. (Banta and Leviton, Proc. California Acad. Sci., ser 4, (1963) 31(11):309-327). Submitted by RICHARD S. FUNK.

DRYMOBIUS MARGARITIFERUS MARGARITIFERUS (Speckled racer). U.S.A., Texas, Cameron Co., National Audubon Society Palm Grove Sanctuary, 4.5 mile SE Brownsville; sighted 11 May 1972, Wayne R. Marion; 30 October 1972 and 6 March 1973, David R. Blankenship. J. R. Dixon and R. A. Thomas. Photograph of specimen deposited Texas Cooperative Wildlife Collection. Raun and Gehlbach, Dallas Mus. Nat. Hist. Bull. (1972)(2) stated that this form was known only from Cameron Co. and was perhaps extirpated. Our records show that it is still present in Cameron Co. Submitted by W. R. MARION, Department of Wildlife and Fisheries Sciences, Texas A&M University, College Station, TX 77843, and D. R. BLANKENSHIP, National Audubon Society, 721 Pine St., Rockport, TX 78382.

SISTRURUS MILIARIUS STRECKERI (Western pigmy rattlesnake). U.S.A., Missouri, Johnson Co., 6 mile E Warrensburg; 11 September 1971; T. J. Berger. J. L. Vial. Specimens destroyed by vandals. Range extension of approximately 150 mile N Barry Co. locality (Anderson, 1965, Reptiles of Missouri). Submitted by THOMAS J. BERGER, University of Missouri - Kansas City, Kansas City, MO 64110.

THAMNOPHIS MARCIANUS (Checkered garter snake). U.S.A., Arizona, Navajo Co. 3 miles S Show Low; 1 August 1966; D. M. Tuttle. R. S. Funk. Collection of R. S. Funk, RSF 1824. First known record in county, and an indication that this snake may penetrate the Mogollon Rim if record can be substantiated, for habitat seems unusual. Submitted by RICHARD S FUNK.

SHORT REPORTS

RECENT COUNTY RECORDS AND RANGE EXTENSIONS FROM SOUTHCENTRAL TEXAS. The following recent records supplement those of Raun and Gehlbach (1972, Amphibians and Reptiles in Texas, Dallas Museum of Natural History).

New county records: Kinney Co., *Scaphiopus couchi* (TNHC 42182-83, 42497-98), *Bufo punctatus* (TNHC 42089-91), *Bufo valliceps* (TNHC 42595), *Kinosternon flavescens* (TNHC 42164-78), *Masticophis taeniatus* (TNHC 42218) *Tantilla gracilis* (TNHC 42204); Maverick Co., *Chrysemys scripta* (TNHC 42571); Uvalde Co., *Drymarchon corais* (TNHC 42181); Zavala Co., *Rana catesbeiana* (TNHC 42194).

Range margin records: Kinney Co., *Crotaphytus collaris* (TNHC 42069), *Sceloporus variabilis* (TNHC 42080).

Range extension record: Kinney Co. 8 mile SW Brackettville, *Coluber constrictor* (TNHC 42278), extends range approximately 90 mile southwest. All specimens collected and identified by Michael R. Lewis; verification by Robert F. Martin. Specimens deposited in the Texas Natural History Collection (TNHC) of the Texas Memorial Museum, The University of Texas at Austin. Submitted by MICHAEL RAY LEWIS, Texas Memorial Museum, Austin, TX 78705.

THE SIGMA XI GRANTS-IN-AID OF RESEARCH AWARDS FOR 1972-73 AND 1973-74 IN "HERPETOLOGY"

Awards for 1972-73

J. W. EDWARD WORTHAM, Southern Illinois University. Spermatozoa of ambystomatid salamanders and their interspecific hybrids. $250.

CARLOS O. DIEFENBACH, University of Michigan. Thermoregulation and gastric digestion in *Caiman crocodilus* (Crocodilia: Reptilia). $100.

JAMES L. EDWARDS, University of California, Berkeley. A comparative study of locomotion in the Urodela. $200.

CARL H. ERNST, George Mason University, Fairfax, Va. An ecological study of the spotted turtle, *Clemmys guttata*. $100.

DONALD F. HARKER, University of Notre Dame. Bioacoustic study of Latin American anurans. $300.

HIROKO B. HOLTFRETER, University of Rochester. Electron microscopic studies of the reacting ectodermal cells during the neural induction of amphibian embryogenesis. $100.

LYNNE D.HOUCK, University of California, Berkeley. Reproductive biology of tropical salamanders. $300.

CLIFFORD R. JOHNSON, Lakeport, Calif. Head-body temperature control and heat distribution in rattlesnakes. $125.

JEFFREY W.LANG, University of Minnesota. Activity patterns and thermoregulatory behavior of crocodilians in Florida $100.

JOSEPH J. SCHALL, University of Texas. Comparative ecology of bisexual and parthenogenetic sympatric species of *Cnemidophorus*. $300.

MARIAN B. VINEGAR, Wilmington College, Wilmington, Ohio. Comparative aggression in lizards. $190.

ALBERT A. WILLIAMS, Southern Illinois University. Karyotypes and homologous chromosomes in some *Ambystoma* salamanders and their interspecific hybrids. $250.

Awards for 1973-74

LEONARD C. IRELAND, Oakland University, Rochester, Mich. Open ocean behavior of the hatchling green sea turtle (*Chelonia mydas*). $100.

PHILIP A. MEDICA, University of Southern California, Los Angeles. Interactions between two closely related species (*Callisaurus draconoides* and *Holbrookia texana* [= *Cophosaurus*]) at the periphery of their distribution in a sympatric situation in northwestern Arizona. $125.

JOSEPH C. MITCHELL, Virginia Commonwealth University. Geographic variation of *Elaphe g.guttata* (Reptilia, serpentes) in the coastal plain. $150.

JAMES J. TALBOT, University of California, Los Angeles. Ecological and evolutionary relationships among lizards of the genus *Anolis* from Costa Rica. $150.

DENNIS S. TOMKO, Northern Arizona University. A behavioral taxonomic study of the collared lizards. $150.

SISTER MARY L. WRIGHT, College of Our Lady of the Elms, Chicopee, Mass. Effect of thyroxine and prolactin on the cell cycle in tadpole limb epidermis. $150.

The SSAR wishes to thank the following Contributing and Sustaining Members who donated an excess of $300 during 1973. This money enabled the SSAR to publish its first number in the new Circular series. We hope this kind of support will be continued and even augmented during 1974.

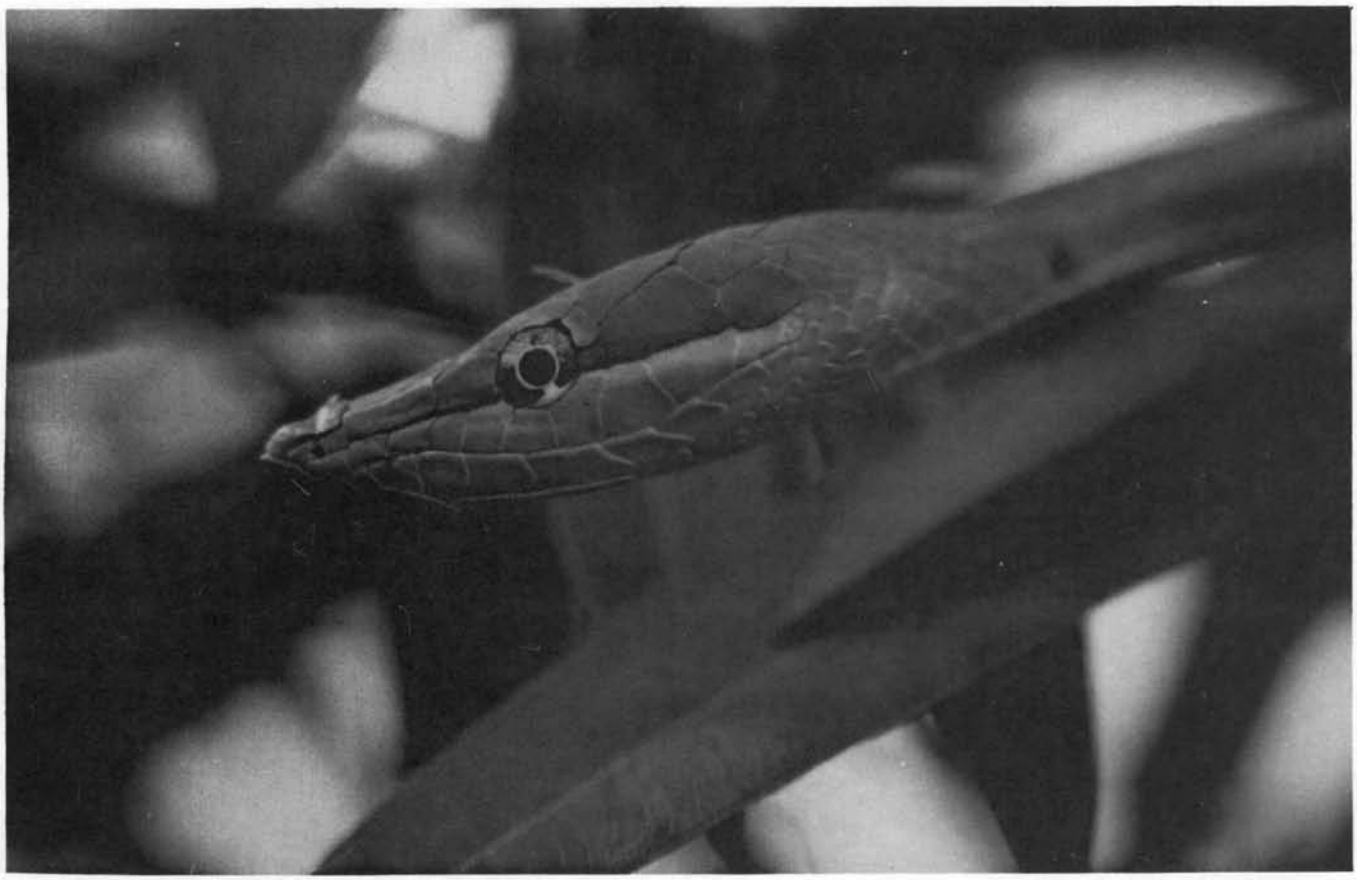
CARIBBEAN RESEARCH



THOMAS A. JENSSEN (Dept. of Biology, Virginia Polytechnic Institute, Blacksburg, Virginia 24061) has completed his field work on Jamaican *Anolis*. The fifteen month project (1970-1971) produced considerable ethoecological data on several species, with the emphasis on *A. opalinus*. Tom has continued his anole work on the mainland where he has spent the past two summers studying the social behavior of *Anolis limifrons* in Panama.

THOMAS MILTON (Dept. of Biology, VPI, Blacksburg, Virginia 24061) is working on the possible social significance of the vocalizations of *Anolis grahami*. He has made two short trips to Jamaica to initiate the study.

STEPHEN D. BUSACK (Bird and Mammal Labs, National Museum of Natural History, Washington D.C. 20560) and RON CROMBIE (USNM) will be spending two weeks in the Swan Islands in February. Their primary interest will be *Aristelliger* but they hope to make a full census of the herpetofauna of these infrequently visited islands.

INDIVIDUALS AND INSTITUTIONS

ROBERT W. HENDERSON of the Milwaukee Public Museum is studying feeding behavior, perch selection, and vertical movements in the neotropical arboreal snake genera *Imantodes*, *Leptophis*, and *Oxybelis*.

Green vine snake, *Oxybelis fulgidus*, from Honduras. (Photo: Robert W. Henderson.

SSAR Liaison Committee
Rare and Endangered Species Report
by
Ray Ashton,
Chairman SSAR Liaison Committee
Museum of Natural History
University of Kansas

The SSAR Liaison Committee to Regional Herp Societies is well into the project of collecting information on the status of rare and endangered species of amphibians and reptiles on a state by state basis. The Committee will send report forms to any individual or group who has the interest and expertise on a state's herptofauna and wishes to have input into this report. A form for each candidate species should be completed and includes information about range, number of specimens representing the species in collections, status of the habitat, etc. Not all of this information will be published in the report but is used to evaluate the species' situation and whether it should be included in the published report. Also, all the raw data will be maintained at the University of Kansas as well as a list of resource people in each state. This information may be valuable to state and federal conservation departments and other groups that may need such information for such things as environmental impact statements and the development of new laws. Exact information on the location of populations will not generally be made public due to potential collecting pressures.

In the end, I hope to put together a report on the U.S. and Canada which will be published and distributed by the SSAR. Hopefully, this will be done by early 1974.

Regional Societies

If your regional society hasn't heard from a member of the Liaison Committee, send a letter to the Committee member in your region and let them know what your society is doing. The members are: Chairman, Ray Ashton, Museum of Natural History, University of Kansas, Lawrence, Kansas; Rocky Mountain Area, John S. Applegarth, P.O. Box 91, Durango, Colorado; Southeast, Robert Thomas, Department of Wildlife and Fisheries, Texas A&M University, College Station, Texas; West Coast, Michael Long, 1206 Electric Avenue Apt. G, Alhambra, California; Midwest, Joseph T. Collins, Museum of Natural History, University of Kansas, Lawrence, Kansas: Canada, Barbara Froom, 8 Preston Place, Toronto 12, Ontario, Canada; and Eastern Seaboard, Marvin L. Skaroff, 1025 Lakeside Drive, Philadelphia, Pa.

SHORTAGE OF RANA CATESBEIANA

IN CALIFORNIA

An article by Jerry Belcher in the San Francisco Sunday Examiner & Chronicle for 20 January 1974 reported that the bullfrog, Rana catesbeiana, is in short supply for scientific supply houses and restaurants. The California Fish and Game Commission has put an indefinite ban on frog hunting of all kinds in Glenn, Colusa, Butte, and Placer Counties. Possible reasons given for the decline of the bullfrog were habitat destruction, pesticides, and poaching. The Fish and Game Commission has authorized a 3-year, $30,000 study to develop a bullfrog management program.

THE CURRENT STATUS OF THE SANTA CRUZ LONG-TOED SALAMANDER - AN ENDANGERED ANIMAL

Stephen B. Ruth

ABSTRACT:

Ambystoma macrodactylum croceum, recently threatened with extinction due to habitat destruction, now appears to have a hopeful future. Studies have shown that the salamanders still exist in good numbers at both previously known sites. The two breeding pond habitats have been purchased as ecological reserves by the State of California. Current research is documenting the extent of terrestrial habitat used by the salamanders. An additional population has been discovered.

Bury and Ruth (1972) reviewed the status of *A. m. croceum*. At that time there were two known populations, and the outlook for their continued survival appeared bleak. A brief resume follows.

The pond at the Valencia Lagoon site had been inadvertently drained due to freeway construction in early 1972. The effect of this action was brought to the attention of the California Division of Highways. Following discussions with federal and state officials and scientists from the University of California, Berkeley, the Highway Division indicated a desire to do what it could to rectify the situation. As an interim measure, an artificial salamander pond 250 feet long by 50 feet wide was built within the highway right of way. The pond was completed in late 1970. At the time of our 1972 report there was no indication that salamanders were using the man-made pond. The remaining two and half acres of former pond habitat adjacent to the freeway was in private hands. The property was zoned commercial, and the owner had plans for filling the area and building an office complex on it.

In the fall of 1971 the other salamander breeding area, known as Ellicott Pond, was in imminent danger of being destroyed by the planned development of a mobile home park. A "lease on life" was granted the salamanders when the Santa Cruz County Board of Supervisors denied a rezoning request by the property owners which, if approved, would have allowed construction to begin.

During the eco-political battle to save the salamanders, it became obvious that not enough was known about them. In January of 1972 studies of *A. m. croceum* were initiated by graduate and advanced undergraduate students working under the direction of Dr. Robert C. Stebbins of The Museum of Vertebrate Zoology, University of California at Berkeley.

In 1972 research was concentrated primarily on determining the number of salamanders using the two sites. Both breeding ponds were encircled with drift fences made of tar paper. Salamanders were captured in can traps and were marked by toe clipping and released. This study and subsequent work has shown that approximately 500 salamanders still exist at Valencia Lagoon and 8,000 - 9,000 at Ellicott Pond.

Once this information had been gathered the California Department of Fish and Game asked for and got funds for habitat acquisition. A 30 acre parcel at Ellicott Pond was purchased for $85,000 by the State in May of 1973 from funds raised through motorists' purchase of personalized license plates. In July of 1973 the portion of Valencia Lagoon which was still in private hands was acquired by the State with $34,500 from license plate funds and a $15,000 gift from Mr. and Mrs. Carlyle Miller, the property owners.

Research in 1973 and 1974 has been concentrated on determining the direction and timing of the breeding migrations as well as the extent of the terrestrial habitat used by the adult salamanders in the vicinity of the ponds. Information on habitat utilization by the adults is especially critical if a viable salamander reserve is to be created. Protection of the pond environment will not be enough to protect this amphibian given the two phases of its life cycle; one aquatic and one terrestrial. The Bureau of Sport Fisheries and Wildlife of the United States Department of the Interior is considering purchasing upland areas that need to be added to the reserves created by the State. At the moment most of the oak-woodland and chaparral habitat surrounding the two ponds is in private hands, and extensive development of these lands could undo most of the hard work that has been done.

In addition the studies have shown that the artificial pond created by the California Division of Highways at Valencia Lagoon was being used by the salamanders. This pond was expanded in November of 1973 to provide additional breeding habitat for the salamanders. The California Department of Fish and Game is negotiating with CALTRANS (formerly the California Division of Highways) to implement a recovery plan drawn up by scientists at Berkeley for the salamanders at the Valencia site. This plan calls for partial damming of the freeway drainage channel in order to reflood the old pond bottom.

In October of 1973, an additional population of Santa Cruz Long-toed Salamanders was discovered in Monterey County one mile north of Moss Landing. The size of this population is not known. Agricultural lands and a salt water marsh nearly surround the pond and willow grove area, where virtually all of the salamanders are presumed to exist.

The necessity of working on an endangered animal on private property as well as the need for constant communication among the many agencies and individuals involved has often confounded and complicated the research effort.

It is hoped that future work will determine the size of the Moss Landing population. The extent of the terrestrial habitat needs to be studied further with more emphasis on areas away from the ponds. In addition a thorough search needs to be made for other populations of this salamander especially in northern Monterey County.

Research on the Santa Cruz Long-toed Salamander has been carried out by students in the Museum of Vertebrate Zoology under the direction of Dr. Robert C. Stebbins. They have been assisted in the field by private citizens and students from the Biology Department at Cabrillo College. Portions of the research effort have been funded by the California Division of Highways, the California Department of Fish and Game, the Bureau of Sport Fisheries and Wildlife, the Martens Fund of the Museum of Vertebrate Zoology, and by the researchers, themselves.

About the SSAR Election!

Since the Tacoma meetings, SSAR has not had the services of HISS to provide mailing labels. Thus, although SSAR ballots were prepared for mailing during September, 1973 there were no additional membership labels for separate mailings. Our ballots had to wait until J. of Herpetology 7(4) was mailed from Ann Arbor in late November. Obviously, the 15 October deadline for ballot receipt was ignored! All ballots received prior to 1974 were counted.

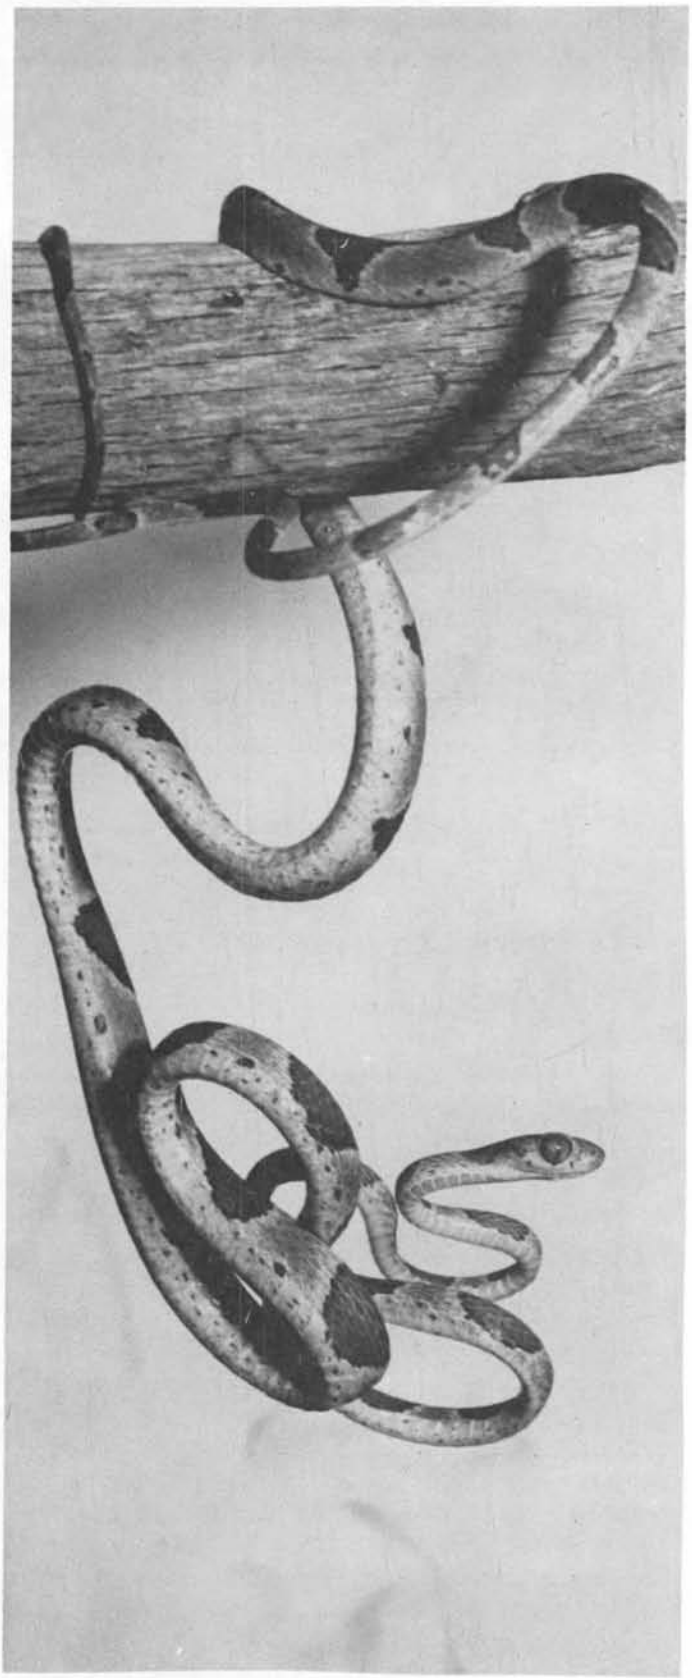
ALFRED S. ROMER DIES



Alfred S. Romer, AAAS president in 1966 and a member of the Association for 50 years,died in November in Washington, D.C. He was 79.

Romer, professor emeritus of zoology at Harvard University, was an authority on vertebrate biology. He was noted for his studies on the braincase and for his reconstruction of the nerves of extinct fish, amphibians, and reptiles. After his retirement in 1965, Romer continued his research at Harvard's Museum of Comparative Zoology.

Romer served as AAAS president-elect in 1965, chairman of the Board of Directors in 1967, chairman of the Committee on Council Affairs in 1965, and chairman of the Committee on Nominations and Elections in 1966.

He had also been president of the Society for the Study of Evolution, the Society of Vertebrate Paleontology, the American Society of Zoologists, and the Society of Systematic Zoology. Among the many honors he received were the Thompson Medal of the National Academy of Sciences, the Academy's Elliot Medal, and the Penrose Medal of the Geological Society of America.

VOLUME 4, NUMBER 6
DECEMBER 1972

SOCIETY FOR THE STUDY OF AMPHIBIANS AND REPTILES

The Society was founded in 1958 as the OHIO HERPETOLOGICAL SOCIETY. Following rapid growth of membership and expansion of operations, the organization became the SOCIETY FOR THE STUDY OF AMPHIBIANS AND REPTILES in 1967.

The SSAR encourages the acquisition of knowledge on amphibians and reptiles, and the dissemination of scientific information of these animals. It encourages the conservation of wildlife in general, and of amphibians and reptiles in particular. A major effort is made to achieve closer cooperation and effective communication between amateur and professional workers. (See Third Cover for membership information.)

HERPETOLOGISTS

LEAGUE

The Herpetologists' League is an international organization which was established in 1936 by Major Chapman Grant. It is dedicated to furthering knowledge of the biology of amphibians and reptiles.

In 1971 it had 900 members and fellows (including Life and Honorary members), and more than 400 institutional subscriptions to its journal, HERPETOLOGICA, which has been published continuously since 1936.

All persons interested in herpetology are eligible for membership. (See Third Cover for membership information.)

204 REPORT ON THE SSAR-HL LAKE TEXOMA MEETING, by Max A. Nickerson.

206 AN IMPORTANT REPORT TO SSAR MEMBERS, by C. J. McCoy.

-- DEPARTMENTS --

CONSERVATION

204 SSAR RESOLUTIONS ON CONSERVATION.

REPORTS

196 REPEATED MATING OF A COPPERHEAD AND TIMBER RATTLESNAKE, by P. W. Smith & L. M. Page.

202 AN UNUSUAL SPECIMEN OF AMEIVA UNDULATA (SAURIA: TEIIDAE) FROM YUCATAN, MEXICO, by Jeremy E. Penner.

203 NESTING SITES, EGGS and YOUNG, of HEMIDACTYLUS MABOUIA FROM CARRIACOU, WEST INDIES, by George B. Pendlebury.

208 AUSTRALIAN ANURAN CHROMOSOME NUMBERS, by David S. Woodruff.

209 CURRENT HERPETOLOGICAL TITLES: XXIII. 1971-1972.

BOOK REVIEW

219 ANFIBIOS DE NICARAGUA: INTRODUCCION A SU SISTEMATICA, VIDA Y COSTUMBRES, by Jaime Villa. Reviewed by Larry D. Wilson and John R. Meyer.

● PUBLICATION OFFICE Herpetological Information Search Systems, The American Museum of Natural History, Central Park West at 79th Street, New York, N.Y. 10024.

+ SUBSCRIPTIONS Individual members of the Society for the Study of Amphibians and Reptiles and of the Herpetologists' League will receive the new HISS publications succeeding HERPETOLOGICAL REVIEW without additional charge in 1973. These are HISS NEWS-JOURNAL and HISS TITLES & REVIEWS.
Annual subscriptions to individuals who are not members of these societies are $6 for each publication.
INSTITUTIONAL SUBSCRIPTIONS to the two new HISS publications are $12 each.
Back Issues of HERPETOLOGICAL REVIEW are available from the SSAR Treasurer at $1.50 per copy (see last page).

● ADVERTISING Advertising is restricted to goods and services pertinent to the interests of subscribers. The CLASSIFIED section is described on the last page.
COMMERCIAL ADVERTISING RATES are available from the Editor.

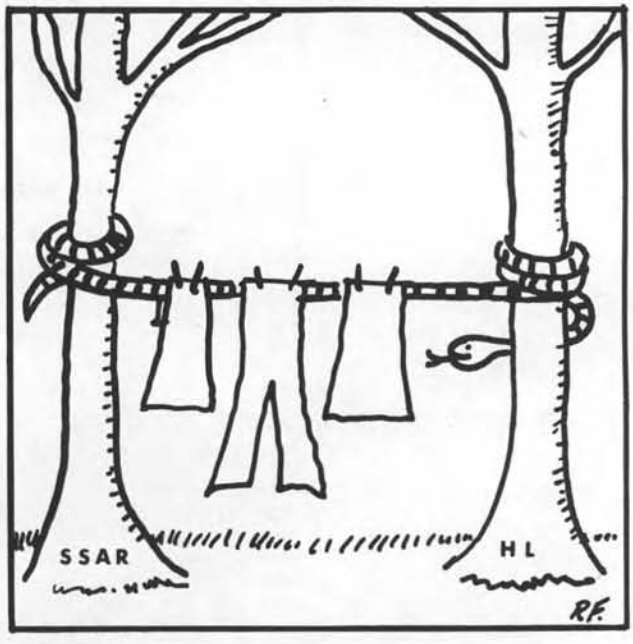
Published bimonthly: February, April, June, August, October, and December.
Copyright © 1972 by the Society for the Study of Amphibians and Reptiles.

EDITORIAL

The passing of an old friend is always a shock, and the passing of HERPETOLOGICAL REVIEW with this final issue is one to all of us -- in spite of our continuing much of the same work on HISS's new publications that we have done in producing HR. It was as much a surprise to us as to anyone when a subcommittee of the SSAR Board came forward at the Lake Texoma Meeting with the idea of the Society giving up its newsletter, and asking HISS to provide a substitute that would be of herpetological-community-wide scope (and more self-supporting). This was only one of several possible alternatives. The coming year will tell us if it was the proper one.

By HISS agreeing to provide SSAR (and later also the Herpetologists' League) the essential services of HERPETOLOGICAL REVIEW in 1973 with new publications at less than the costs of production, we have taken the major financial load off these societies for the year -- and assumed them ourselves. Unless, however, HISS is able to locate the needed additional income in this period, the societies will face the problem again in 1974 -- and without the funds that they withdrew from their slim reserves to assure production in 1973.

We at HISS believe that only a truly international herpetological society can provide the variety of publications and services that the herpetological community (along with its fringe members) needs and deserves. This is the reason that we were such firm supporters of the movement toward amalgamation of the SSAR and the Herpetologists' League. In spite of statements to the contrary, we still believe that the individual member would receive more and be able to contribute more to a unified, comprehensive society representing the needs of all individuals and groups who are interested in amphibians and reptiles (be they amateurs, professionals, or para-herpetologists with a major interest in ecology, embryology, or physiology). The plain fact is that there are too few professional herpetologists to carry alone the costs of their publications and services.



Amalgamation will not come about in 1973, anyway, so HISS will be trying to find that magic combination that will allow herpetologists to share their costs, as well as their information, with the many groups that have an interest in some aspect of the biology of amphibians and reptiles. The community-wide newsletter, the lists of current titles, and the yearbook are moves in this direction. We will need aid, ideas, and financial support for all of these. Please do not expect us to go it alone! -- HGD.

TRANSPORTATION FROM WEST COAST TO SAN JOSE, COSTA RICA FOR ASIH MEETINGS, JUNE, 1973

Charter Flight from Los Angeles direct to San Jose, Costa Rica; depart Los Angeles June 23, return July 5 -- total cost $255. Hotel accommodations $72.00 per person for week of meetings. Package includes tour of city and transfers to and from hotel. Prices subject to having maximum number of reservations to make charter possible. Send letters of inquiry by February 1, 1973 to Ms. Magnolia Small, Secretary to Jay M. Savage, Allan Hancock Foundation, University of Southern California, Los Angeles, California, 90007; (213) 746-2917 or 746-2073.

GREAT LAKES HERPETOLOGICAL SOCIETY

Mr. J. K. Langhammer (Detroit Zoo) kindly brought to our attention the error we made in HERPETOL REV 4(1): 8 in listing this society as extinct. From his letter, we understand that the GLHS is alive and well and that the report of its death is greatly exaggerated, as Mark Twain commented when another careless editor made the same mistake about him. Our apologies to GLHS, and we do hope that you will keep us informed of your activities so we may be able to print happier news about you in the future. -- IG.

CAN ANYBODY TIE A GOOD KNOT ?

MEETINGS AND SOCIETIES

CALENDAR 1972

26-31 December....AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE, Annual Meeting, Washington, D.C.

28-29 December....HERPETOLOGISTS' LEAGUE, Annual Meeting (Cosponsored by the SSAR), Washington, D.C.

CALENDAR 1973

24-30 June....AMERICAN SOCIETY OF ICHTHYOLOGISTS AND HERPETOLOGISTS, Annual Meeting, San Jose, Costa Rica.

4-11 August....FIRST INTERNATIONAL CONGRESS OF SYSTEMATIC AND EVOLUTIONARY BIOLOGY, Boulder, Colorado.

CALENDAR 1974

June....AMERICAN SOCIETY OF ICHTHYOLOGISTS AND HERPETOLOGISTS, Annual Meeting, Ottawa, Canada.

The DIVISION OF VERTEBRATE MORPHOLOGY of the American Society of Zoologists will be meeting with the AAAS in Washington. Among the papers in a Symposium on Vertebrate Sound Production are the following of especial interest to herpetologists:

R. S. SCHMIDT, Central Mechanisms of Frog Calling.
W. F. MARTIN & CARL GANS, Functional Anatomy of Sound Production by Bufo.
C. GANS & P.F.A. MADERSON, Sound Production in Modern Reptiles: Review and Comments.

DUES ARE RISING EVERYWHERE

The INTERNATIONAL SOCIETY ON TOXINOLOGY has announced that 1973 dues will be $17.50.

The AMERICAN ASSOCIATION OF UNIVERSITY PROFESSORS announced increased dues that brought them to a minimum of $12 (for persons making less than $8,000) and a maximum of $36 (for those making $15,000 or more).

Active membership in the NEW YORK ACADEMY OF SCIENCES is now $35.

INDIVIDUALS AND INSTITUTIONS

JUAN R. LEON (Univ. Oriente, Venezuela) has returned to the University of Kansas to work toward his doctorate.

WILLIAM G. DEGENHARDT (Dept. Biology, Univ. New Mexico, Albuquerque, NM 87106) has received a grant of $26,000 from the National Science Foundation for a two-year study of niche expansion in Eleutherodactylus in Puerto Rico and the Virgin Islands. Graduate student KIRKLAND JONES started field work in September 1972.

Dr. EDWARD J. GREDING, Jr. (Dept. Biologia, Universidad de El Salvador) wishes to advise that he has been unable to receive mail at the University for the past month due to a military takeover and shutdown of the University and the automatic discharge of the entire faculty. If reprint requests or letters have been unanswered, please direct them to him at P.O. Box 1379, San Juan, Texas 78589. They will be forwarded from that address. This condition will extend indefinitely into the future.

MICHAEL WILLIAMSON is the new President of the New Mexico Herpetological Society.

The NEW YORK ZOOLOGICAL SOCIETY has announced the closing of SIMLA, its field station in Trinidad, and the establishment of a new CENTER FOR FIELD BIOLOGY under the leadership of GEORGE SCHALLER.

The BRITISH HERPETOLOGICAL SOCIETY has announced the appointment of a Conservation Committee, to collect information on the habits of British amphibians and reptiles "which appear to be decreasing."

ERIK H. Th. van EIJSDEN (Stephensonstratt 1, The Hague, Netherlands) would like a copy of "A revision of the African lizards of the family Gekkonidae (BULL MUS COMP ZOOL 98, 1947), by Arthur Loveridge. He is also interested in live specimens of the genus Phyllodactylus (Neotropical and Nearctic). Conditions of trade or purchase to be arranged.

HERBERT H. HARRIS, Jr. & ROBERT S. SIMMONS (Dept. Herpetology, Natur. Hist. Soc. Maryland, 2643 N Charles St., Baltimore, MD 21218) are researching the distribution and taxonomy of Crotalus and Sistrurus (particularly the Mexican forms). They would appreciate all correspondence on specimens, data, etc.

RICHARD J. BALDAUF has resigned his position at Texas A & M University to accept the new post of Curator of Education at the Kansas City Museum. He will be responsible for building new educational programs, with especial emphasis on environmental education.

REPEATED MATING OF A COPPERHEAD AND TIMBER RATTLESNAKE

Philip W. Smith & Lawrence M. Page

On July 17, 1970, a male Agkistrodon contortrix laticinctus from south Texas and Crotalus h. horridus from West Virginia, which shared the same cage, were observed mating. The Agkistrodon, which had been reared from a baby, had from time to time courted cage mates of various species. The Crotalus had also been captive several years but had been housed in a separate cage. The mating lasted approximately five hours. No young resulted.

On August 18, 1971, just 13 months later, the two snakes again mated for at least three hours. In both instances the snakes were highly excited, and the male copperhead appeared to be in some discomfort. No young resulted from the second mating.

A natural hybrid Crotalus horridus X Sistrurus catenatus from Iowa was reported by Bailey (1942). We are not aware of any intergeneric hybrids between Crotalus and Agkistrodon, nor of any other reported matings between species of these genera. In view of the two separate observations reported herein, we assume that hybridization cannot occur between a male Agkistrodon contortix and female Crotalus horridus. We are thus spared the necessity of coining the common name of "rattlehead" for the hybrid that might have resulted.

BIOSIS ANNOUNCEMENTS

BioSciences Information Service of Biological Abstracts (2100 Arch St., Philadelphia, PA 19103) has announced the following appointments:

PHYLLIS V. PARKINS to Executive Director of BIOSIS.

H. E. KENNEDY to Deputy Executive Director & Director for Scientific Affairs.

J. R. SMITH to Director for Research and Development.

ROBERT R. VAN GULICK to Director for Business & Finance.

BIOSIS has also reported the establishment of a cooperative systems program with CHEMICAL ABSTRACTS SERVICE which will help to eliminate duplication and allow the two services to be used in combination.

UNIV KANSAS HERPETOLOGICAL PAPERS

The Museum of Natural History, University of Kansas, Lawrence, KS 66044, is offering for sale sets of the herpetological papers published in the University of Kansas Publications, Museum of Natural History (Vols. 1-20), including several considered out-of-print.

30 sets, complete. Original except xerox of 1(6)... $50 plus $4 shipping

20 sets, original. Lacking 1(6) & 15(7)... $47.50 + $3.50 shipping

20 sets, original. Lacking 1(6), 8(3), & 15(2,7,12)... $40 + $3 shipping

Orders will be processed by the Publications Secretary on a first-come, first-served basis. Payment should accompany order.

OBITUARY

C. CLIFFORD CARL (1908-1970), author of several museum handbooks including The Amphibians of British Columbia and The Reptiles of British Columbia (both in several editions) and numerous other papers on the amphibians and reptiles of that region, died on 27 March 1970.

LEWIS H. BABBITT, long-time Massachusetts herpetologist, died at the age of 69 on 29 September 1972.

THE WASHINGTON MEETING

of the

HERPETOLOGISTS' LEAGUE

28 - 29 DECEMBER 1972

MEETING ROOM: The meetings of the Herpetologists' League will be held in the Auditorium of the Museum of History and Technology, through the assistance of Dr. James Peters and Dr. George Zug.

Note: The Executive Council of the Herpetologists' League meeting at the University of Oklahoma Biological Station in August voted to disaffiliate from AAAS. The main reason for this action was the increasing high costs assessed by the AAAS for handling meeting arrangements. We are meeting in Washington, D. C. this December because of previous commitment to this time, but have made arrangements to meet separately from the AAAS.

REGISTRATION: No registration is planned for this meeting.

HOUSING RESERVATIONS: Members planning to attend the meetings should either make their own arrangements or they may wish to place their arrangements through the facilities set up by the AAAS. The forms for such reservations are published in the fall issues of SCIENCE. It should be pointed out, however, that the hotels in which the AAAS meetings are being held are about five miles away. No one should try to alternate sessions with less than an hour's leeway. The hotels near the Museum are not of first quality, but are adequate and less expensive than the others. They are the:

EBBITT HOTEL, 1000 H Street NW. Phone 202 NA8-5034. Single with bath: $12.60.

EVERETT HOTEL, 1730 H Street NW. Phone 202 298-8464. Single with bath: $8.00.

HARRINGTON HOTEL, 11th & E Street NW. Phone 202 NA8-8140. Single with bath: $11.75 to $13.00, depending on size and location.

SEE THE ACCOMPANYING SKETCH FOR LOCATIONS.

EXECUTIVE COUNCIL MEETING: The Executive Council meeting for the Herpetologists' League will be held in the hotel room of one of the officers attending.

SYMPOSIUM

BIOSYSTEMATICS OF SCELOPORUS

THURSDAY, DECEMBER 28, 1972 Auditorium of the Museum of History and Technology of the Smithsonian Institution.

9:00 AM Chairman: CHARLES C. CARPENTER (Vice President, Herpetologists' League)

Comparative population genetics and the evolution of Sceloporus. WILLIAM P. HALL, III (Museum of Comparative Zoology, Harvard Univ., Cambridge, MA 02138).

A numerical approach to geographic variation in Sceloporus undulatus. JAMES R. PURDUE (Department of Zoology, Univ. of Oklahoma, and the Oklahoma Biological Survey, Norman, OK 73069).

Phylogenetic conclusions from cranial osteology and other characters in Sceloporus (Iguanidae). KEN LARSEN (Department of Zoology, Brigham Young Univ., Provo, UT 84601).

Phylogenetic considerations of display behaviors in the genus Sceloporus. CHARLES C. CARPENTER (Department of Zoology and the Stovall Museum of Science and History, Univ. of Oklahoma, Norman, OK 73069).

CONTRIBUTED PAPERS

THURSDAY, DECEMBER 28, 1972 Auditorium of the Museum of History and Technology of the Smithsonian Institution.

2:00 PM Chairman: MAX A. NICKERSON (Vertebrate Division, Milwaukee Public Museum, Milwaukee, WI 53223)

Chelonian mental glands. ROBERT M. WINOKUR and JOHN M. LEGLER (Department of Biology, Univ. of Utah, Salt Lake City, UT 84112).

Functional anatomy and evolution of burrowing in gopher tortoises. DENNIS M. BRAMBLE (Department of Biology, Univ. of Utah, Salt Lake City, UT 84112).

Effect of temperature, salinity, and photoperiod on the number of trunk vertebrae in Ambystoma maculatum. ROBERT B. PEABODY (336 Long Hall, Clemson Univ., Clemson, SC 29631).

Regional patterns of proportional variation in trunk vertebrae of Batrachoseps. SAMUEL S. SWEET (Museum of Vertebrate Zoology, 2593 Life Sciences Building, Univ. of California, Berkeley, CA 94720).

Observations on patterns of regional distribution of the salamander fauna of northern Central America. DAVID B. WAKE and JAMES F. LYNCH (Museum of Vertebrate Zoology, 2593 Life Sciences Building, Univ. of California, Berkeley, CA 94720).

An analysis of variation of scutellation in Anolis carolinensis carolinensis. RONALD K. GRATZ (Department of Zoology, Univ. of Oklahoma, Norman, OK 73069).

Microdermatoglyphics: a new tool for reptile taxonomy. HERNDON G. DOWLING, ITZCHAK GILBOA, DORIS E. GENNARO, and JOSEPH F. GENNARO, JR. (Department of Herpetology: HISS, American Museum of Natural History, New York, NY 10024).

Scanning electron micrographs of snake scales as a taxonomic tool. PATRICIA J. KIMMICH (Museum of Zoology, Louisiana State Univ., Baton Rouge, LA 70803).

Scanning electron microscopy of lizard scales. GLENN R. STEWART (Biological Sciences Department, California State Polytechnic Univ., 3801 West Temple Avenue, Pomona, CA 91766).

8:00 PM Executive Council Meeting. To be arranged.

FRIDAY, DECEMBER 29, 1972 Auditorium of the Museum of History and Technology of the Smithsonian Institution.

9:00 AM Chairman: RONALD K. GRATZ (Department of Zoology, University of Oklahoma, Norman, OK 73069).

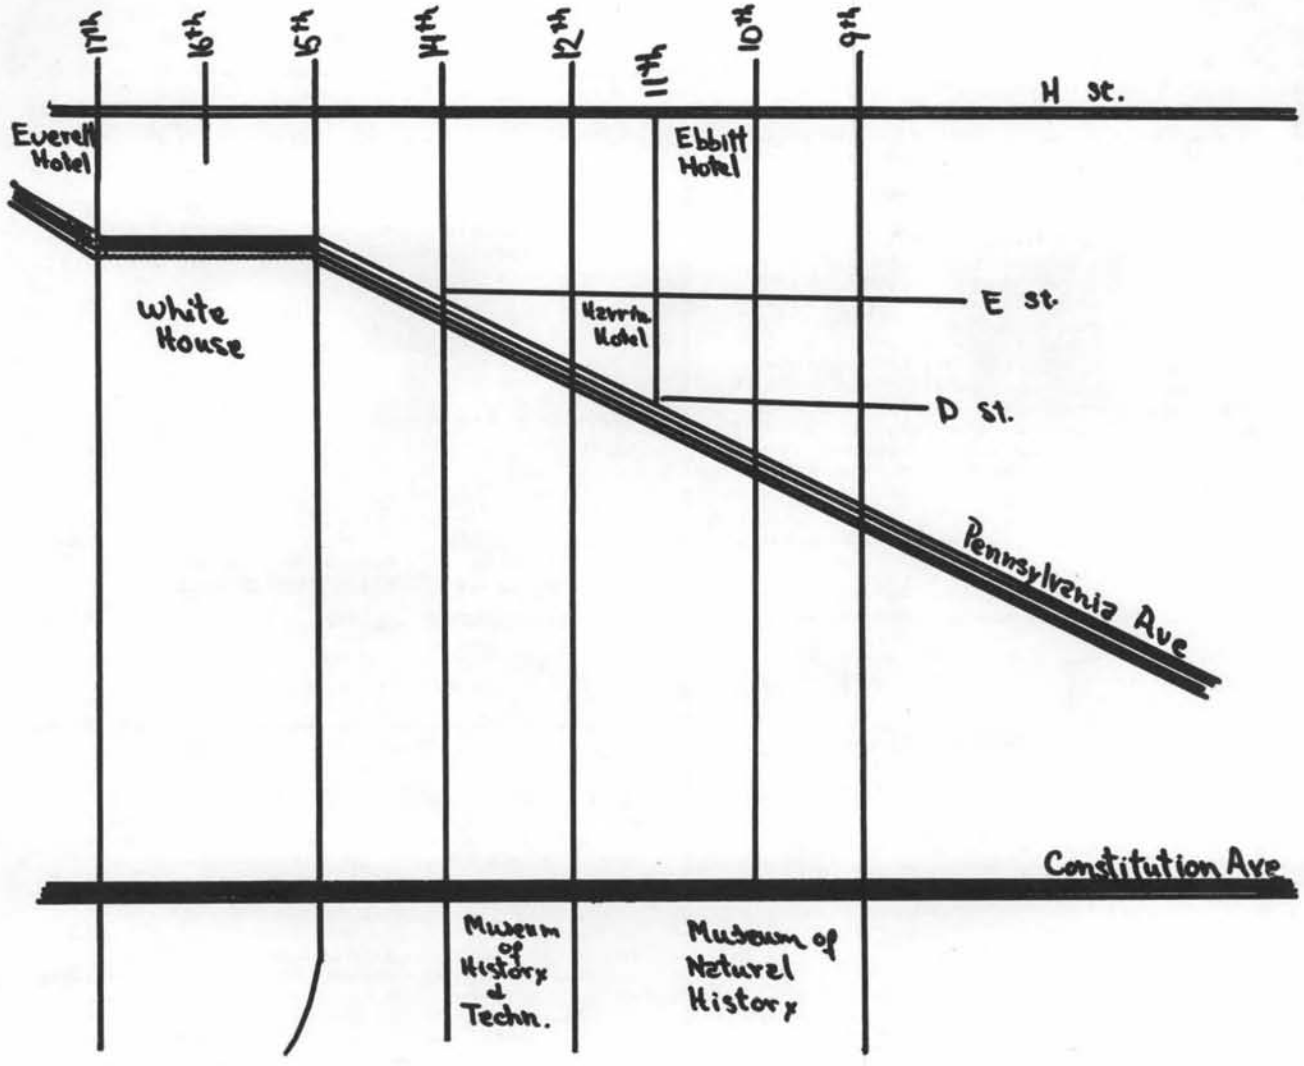
Intensity and spectral preferences in anurans: A model of phototaxis. ROBERT G. JAEGER and JACK P. HAILMAN (Department of Zoology, Birge Hall, Univ. of Wisconsin, Madison, WI 53706).

Effect of light- and dark-adaptation on the phototactic responses of anurans to intensities and colors. JACK P. HAILMAN and ROBERT G. JAEGER (Department of Zoology, Birge Hall, Univ. of Wisconsin, Madison, WI 53706).

Telemetric study of movements and thermoregulation of the racer Coluber constrictor mormon, in northern Utah. WILLIAM S. BROWN and WILLIAM S. PARKER (Department of Biology, Univ. of Utah, Salt Lake City, UT 84112).

The role of basking in the pond turtle, Clemmys marmorata. R. BRUCE BURY (Bird and Mammal Laboratories, U. S. National Museum, Washington, DC 20560).

Growth, population size, and basking behavior of Chrysemys picta in a woodland pond. LAURENCE E. BAYLESS (Department of Biology, Concord College, Athens, WV 24712).



Some observations on the behavior of captive Ahaetulla prasina praeocularis. RONALD K. GRATZ (Department of Zoology, Univ. of Oklahoma, Norman, OK 73069).

Ecology of the desert horned lizard, Phrynosoma platyrhinos. WILMER W. TANNER (Department of Zoology, 575 WIDM, Brigham Young Univ., Provo, UT 84601).

An experimental study of aposematic coloration in the salamander Plethodon jordani. JOHN L. HENSEL and EDMUND D. BRODIE, JR. (336 Long Hall, Clemson Univ., Clemson, SC 29631).

11:00 AM Annual Business Meeting, Herpetologists' League. T. PAUL MASLIN, President, Herpetologists' League (Curator of Zoological Collections, University of Colorado Museum, Boulder, CO 80302).

END OF MEETING

SKETCH-MAP of the Museums area of Washington, D. C.

ABSTRACTS OF PAPERS

Bayless, Laurence E. (Concord Coll.). Growth, population size, and basking behavior of Chrysemys picta in a woodland pond.

Population parameters, growth rates, and habitat utilization for basking were studied for Chrysemys picta in a 7 acre pond near Rensselaerville, New York. Effect of capture method on results also was considered. Turtles were caught by grabbing, dip netting, and trapping, individually marked, and further studied by recapture and telescopic observation. Population size and density are lower than expected from published figures, perhaps because of a relative scarcity of shallows with emergent vegetation along the pond margins. Sex ratio is 1:1. Juvenile recruitment appears to be low and to vary greatly from year to year. Carapace length-plastron length-total weight relationships and growth rates were determined. Capture method affects sex ratios and age classes, probably because of differences in basking behavior and habitat between males, females and juveniles. Individual turtles also differ greatly in response to capture by the various methods, introducing extreme bias into some recapture rates.

BRAMBLE, DENNIS M. (Univ Utah). Functional anatomy and evolution of burrowing in gopher tortoises.

Gopher tortoises comprise two distinct phyletic lines that probably warrant generic recognition. Differences in burrowing habits account for many of the morphological features that distinguish the groups. The more conservative lineage includes Oligocene Gopherus laticunea and Recent G. agassizii and berlandieri. Members of this group have evolved a manus structurally adapted for digging in resistant soils as well as for efficient locomotion. The head is not employed in burrowing and the skull and neck vertebrae exhibit no fossorial modifications. The second lineage includes Recent G. flavomarginatus and polyphemus and fossil forms dating back to Miocene G. brevisterna. Selection in this lineage has been for the development of a manus suitable for digging in sandy, friable soils. In addition, members of the group utilize the head in digging and display related specializations of the cranium and cervical vertebrae, including a unique cervical locking mechanism. A hypertrophied inner ear and massive otolith also characterize the lineage and may be related to "head burrowing".

BROWN, WILLIAM S. and WILLIAM S. PARKER (Univ. of Utah). Telemetric study of movements and thermoregulation of the racer, Coluber constrictor mormon, in northern Utah.

Four females migrated 630, 700 and 970 m in 4-9 days from hibernacula to home ranges in spring 1971 and 1972. One individual used a nearly identical migratory path and subsequent home range both years. Mean rate of travel during migration on movement days was 151 m/day. In summer, nine females moved mean distances of 16.3 to 55.7 m between successive locations. Home range moves averaging 25 to 30 m appear typical. Mean body temperatures in four categories of location or activity were: (1) underground, 18.0 to 27.5 C (time-dependent); (2) under rocks, 25.6 C; (3) moving on surface, 33.1 C; and (4) regulating, 33.0 (AM) to 34.6 C (PM). Before solar radiation is effective, body temperatures of snakes underground slightly exceed air and surface substrate temperatures. After emergence, a period of basking is followed by relatively quiescent regulation in the sun-shade mosaic, a behavior pattern apparently unusual among some temperate lizards, but possibly more common among diurnal, heliothermic snakes.

BURY, R. BRUCE (Bureau of Sport Fisheries and Wildlife). The role of basking in the pond turtle, Clemmys marmorata.

Basking is one of the most obvious habits of freshwater turtles, yet little is known about this biological phenomenon. Studies were done on unrestrained C. marmorata to provide information on the major features of basking behavior. This species used aquatic and atmospheric basking strategies. The aquatic basking consists of "sunning" with part of the shell exposed on the surface and of selection of warm waters. The latter behavior comprises a major portion of the daily activities in C. marmorata. Observations on atmospheric basking reveal that: (1) most "sunning" occurs between 0830 and 1130 hrs; (2) sunlight triggers and terminates most basking out of water; (3) long periods of basking take place early in the day; and (4) local habitat conditions greatly influence the lenght and type of basking. Responses of turtles include changes in orientation and posture, periodic returns to the water, partly wetting the body, use of shade, and combinations thereof. Such responses serve a thermoregulatory function, and indicate that basking is an active, complex behavior in freshwater turtles.

DOWLING, GILBOA, GENNARO, & GENNARO (Amer. Mus. Natur. Hist., & N.Y. Univ.). Microdermatoglyphics: a new tool for reptile taxonomy.

Investigation of the surface structure of reptile epidermal scales by scanning-electron microscopy has shown the characters made visible by this technique to have a high degree of intraspecific similarity.

Epidermal scales of snakes of the genus Crotalus and Bothrops, as well as others, not only show unique patterns and virtual identity for members of the same species, but also have meaningful similarities at the generic level.

Thus, this preliminary survey of a few species indicates that microdermatoglyphics shows great promise of species identification from a single epidermal scale, as well as enhancing our information on reptile phylogeny.

Hailman, Jack P. and Robert G. Jaeger (Univ. of Wisconsin, Madison). Effect of Light- and Dark-adaptation on the Phototactic Responses of Anurans to Intensities and Colors.

Our previous work has shown that frogs under an intermediate state of visual adaptation seek a particular illumination: the "optimum ambient illumination" (O.A.I.), which differs among species. When the illumination is below this optimum, animals move toward "blue" stimuli, but when it is above the O.A.I. they show no true-color preference. We now report that the species' O.A.I. is shifted by the state of adaptation. Animals seek a lower illumination value during dark-adaptation and a higher value during light-adaptation. Not only is this preference for intensity shifted but the cross-over intensity between the blue-preference and the no-color-preference responses to spectral stimuli is similarly shifted. These results indicate that the phototactic preferences for intensity and colors are intimately related, probably both in terms of physiological mechanisms and the function such behavior serves under natural conditions.

JOHN L. HENSEL and EDMUND D. BRODIE, JR. (Clemson University) An Experimental Study of Aposematic Coloration in the Salamander Plethodon jordani.

Three morphs of Plethodon jordani were presented to wild avian predators. These morphs were red-cheeked, red-legged, or with no red coloration. The avian predators (Bluejays, Grackles, and Brown Thrashers) were divided into three groups of ten birds each, each group receiving a different morph. It is known that red-cheeked Plethodon jordani have a secretion that makes them distasteful to wild avian predators, while Desmognathus are not distasteful and will be readily eaten. All birds were fed one of the morphs along with Desmognathus until avoidance of the morph was achieved. Some birds never exhibited avoidance and were eliminated. Totals for the three groups were compared using the chi-square test of independence. They were compared on a survival or non-survival basis between morphs and control Desmognathus. There was a significant difference between the percentage of Plethodon jordani and Desmognathus killed or eaten for all morphs except naturally all black. Red-legged animals were avoided to a significantly greater extent than any of the other groups.

Jaeger, Robert G. and Jack P. Hailman (Univ. of Wisconsin, Madison). Intensity and Spectral Preferences in Anurans: A Model of Phototaxis.

A survey of 121 species of anurans from 16 families indicates that each species has a preference for a particular intensity of white light: the "optimum ambient illumination" (O.A.I.). Individuals experiencing illumination below the O.A.I. move so as to increase the ambient illumination while those experiencing illumination above the O.A.I. move so as to decrease the illumination. It now appears that the much-studied "blue" preference of anurans is really a function of the O.A.I. Frogs presented with spectral cues at intensities below the O.A.I. show the typical preference for the "blue" area of the spectrum, which seems to be a true color preference. However, if the intensity is raised above the O.A.I., the phototactic response resembles a U-shaped spectral threshold curve. In the latter case, high responsiveness to the ends of the visible spectrum (red and violet) and low responsiveness to blue and green appears to be a function of the spectral sensitivity of the anuran's eye and not a true spectral preference.

KIMMICH, PATRICIA J. (Ia. State Univ.) Scanning electron micrographs of snake scales as a taxonomic tool.

A preliminary examination of over 100 species representing 63 genera and 7 families indicates that scale microtopography is a useful systemic guide. Characteristics of varied topographic features enable groupings of species generally agreeing with current taxonomy. Noted discrepancies have been found, for example, in Regina, Seminatrix and Natrix.

PEABODY, ROBERT B. and EDMUND D. BRODIE, JR. (Clemson Univ.) Effect of Temperature, Salinity, and Photoperiod on the Number of Trunk Vertebrae in Ambystoma maculatum

The effect of temperature, salinity, and photoperiod on the number of trunk vertebrae in Ambystoma maculatum was studied using field collected eggs from the first through the fourth cleavage stages. Eggs were divided into groups of approximately three hundred and maintained from the stage at collection until after hatching under controlled conditions. Groups were maintained (1) at temperatures of 5, 10, 15, 20, and 25°C using field collected larvae as controls; (2) at salinities of 0.3% and 0.6% using 0.15% as a control; and (3) at photoperiods of 11 and 14 hours of light per day using 12 hours of light per day as a control. Vertebral counts made on 502 cleared and stained animals resulted in a range of 14 to 16 with a mode of 15 trunk vertebrae. Results indicate a significant positive correlation of vertebral number with increased salinity, negative correlation of vertebral number with increased temperature, and no significant correlation of vertebral number with photoperiod. The dependence of vertebral number on each of the three treatments (temperature, salinity, and photoperiod) was tested by a Chi square test of independence at the 0.01 significance level.

STEWART, GLENN R. (California State Polytechnic Univ.). Scanning electron microscopy of lizard scales.

ABSTRACT NOT RECEIVED.

SWEET, SAMUEL S. (Univ. Calif. Berkeley). Regional patterns of proportional variation in trunk vertebrae of Batrachoseps.

The elongate salamanders of the genus Batrachoseps show absolute and relative changes in vertebra length and breadth regionally along the column. These features vary through ontogeny and among species. Ontogenetic changes include relative length increase, transverse process extension, and enhancement of regional trends with increasing age. Species differ in the number of presacral vertebrae, proportions in the neck and sacral regions, and degree of paedomorphic influence. B. aridus has an elongate atlas, and mid-trunk vertebrae of B. wrighti are considerably longer than other species. B. relictus, attenuatus and major are characterized by increasing paedomorphic influence and numbers of trunk vertebrae. B. pacificus, simatus and stebbinsi resemble one another and can be separated from the members of the relictus species group. Trends in the genus include proportional changes associated with the transition from a standing wave towards a travelling wave form of locomotion, and the evolution of a flexible neck in these tongue feeding plethodontids.

TANNER, WILMER W. (Brigham Young Univ.). Ecology of the desert horned lizard, Phrynosoma platyrhinos.

ABSTRACT NOT RECEIVED.

WAKE, DAVID B. and JAMES F. LYNCH (University of California, Berkeley...)

Observations on patterns of regional distribution of the salamander fauna of northern Central America.

The area between the Isthmus of Tehuantepec and the lowlands of Nicaragua is a major center of salamander diversification. Salamanders occur from sea level to nearly 4000 meters, with the greatest diversity in cloud forests between 1000 and 2500 meters. Highland species are structural and ecological generalists, with broad distribution. Their relatives occur to the north of the Isthmus of Tehuantepec. Intermediate elevations are characterized by endemic species with restricted distributions. These species form groups characterized by allopatry, with close relatives usually being found in immediately adjacent regions. The highly specialized lowland species have broad ranges and low densities. They have both southern and northern relatives. Specific examples are chosen to illustrate the above generalizations as well as faunal distributional patterns on the Guatemalan Plateau, the Sierra Madre of coastal Chiapas and Guatemala, the Pacific volcanic chain, and the major mountain masses of inland Chiapas and Guatemala (supported by NSF grant GB 17112).

WINOKUR, ROBERT M. AND JOHN M. LEGLER (Univ. of Utah). Chelonian mental glands

Mental glands are paired integumentary holicrine glands located between the mandibular rami. They occur in the Testudinidae and both subfamilies of the Emydidae. All genera but one of the Emydidae (Batagur) and two of the Testudinidae (Pyxis and Acinixys) have been examined. Mental glands were found in all but five genera of the subfamily Batagurinae but in only two genera (Clemmys and Dierochelys) of the subfamily Emydinae. Mental glands are placed in three categories on the basis of histology as follows: Class I -- multilobed and occurring only in Gopherus; Class II -- non-lobed, distinctly glandular, and occurring in various batagurines; Class III -- paired, deep invaginations of the mental skin, lacking distinctly glandular cells and occurring in the Emydinae and some batagurines. Class III glands may be inactive stages or vestiges of Class II glands. It is known that the secretions of mental glands in Gopherus elicit combat behavior in males. The function of mental glands in the Emydidae is unknown; data on sexual and seasonal variation are incomplete and inconclusive.

AN UNUSUAL SPECIMEN OF *AMEIVA UNDULATA* (SAURIA: TEIIDAE) FROM YUCATAN, MEXICO

Jeremy E. Penner

Naturally occurring abnormalities of the limbs and digits are rare in lizards, although fairly common in frogs. Syndactyly (Munyer, 1963) and polydactyly (Loewen, 1941) have been reported for *Sceloporus undulatus*, although in searching through the literature, no other examples of limb or digit abnormalities in lizards were found.

On February 2, 1969, I collected a juvenile specimen of *Ameiva undulata* approximately 2 km E of Progreso, Yucatan, Mexico. The specimen was unique in that the distal portions of both pairs of limbs were lacking. When discovered, the lizard attempted escape with wriggling motions of the body, the useless limbs being brought against the substrate, but its forward progress on the loose sandy soil was meager compared to the amount of energy expended. The animal was preserved, and subsequent stomach content analysis revealed no food. The difficulty in locomotion and the lack of food indicated a genotype of low selective value.

Embryonic experiments indicate that the ectodermal apical ridge of the limb bud in the chick is essential for the development of the distal portion of the limb (Balinsky, 1960). If the formation of the apical ridge is inhibited, the distal portion of the limb cannot form, although the girdle develops normally, and a short piece of cartilage representing the humerus or femur may develop. In this specimen (U.S. Nat. Mus. 194614), the genotype may have resulted in the suppression of apical ridge formation on all limb buds.

FIGURE 1. Specimen of *Ameiva undulata* without distal limb elements.

The author would like to express his appreciation to George Zug for his aid in reviewing the manuscript.

NESTING SITES, EGGS AND YOUNG OF *HEMIDACTYLUS MABOUIA* FROM CARRIACOU, WEST INDIES

George B. Pendlebury

Carriacou, located 210 km southeast of Barbados, is the largest of the Grenadine Islands. The house gecko *Hemidactylus mabouia* (Moreau de Jonnes), introduced into South America and the West Indies from Africa, has established itself on Carriacou and is a relatively common member of the island's herpetofauna.

The nocturnal lizards normally lay their eggs in natural situations such as rock crevices and hollows in trees. However, when these creatures take up residence in human habitations and their environs, artificial nesting sites are commonly utilized.

On June 27, 1967 the writer found a clutch of two eggs in a hole left where a piece of mortar had fallen from a stone wall. The same day, a young boy from the town of Windward brought me three eggs which he found in a hole in the wall of his house. While these occurrences are not extraordinary, less orthodox nesting sites were found in a house 0.7 km south-southwest of Windward.

On July 4, 1967 I found eight eggs in a latch of the kitchen door, (Fig. 1). The empty shells and the random orientation of the openings suggests that these eggs hatched, and were not broken as a result of the door's frequent use. Eleven days later, I found six eggs in the space behind some books in a bookcase. One of these eggs hatched the following day. The remainder were sacrificed and found to be in different stages of development. This, plus the fact that geckos generally lay no more than a pair of eggs, indicates that a number of these lizards were making concurrent use of the same nesting sites. These observations support the findings of Pienaar (1966) who reported that particularly favorable spots are used as communal depositories by *H. mabouia* in Africa.

Spec. No.	Date of Capture	Length (mm) Snout-vent	Total
GBP-C- 4	July 16, 1967	21	40
GBP-C- 9	July 2, 1967	22	42
GBP-C-10	July 5, 1967	25	51
GBP-C-22	July 31, 1967	23	44
GBP-C-23	August 2, 1967	23	41

Table 1. Measurements of young *Hemidactylus mabouia* from Carriacou, West Indies.

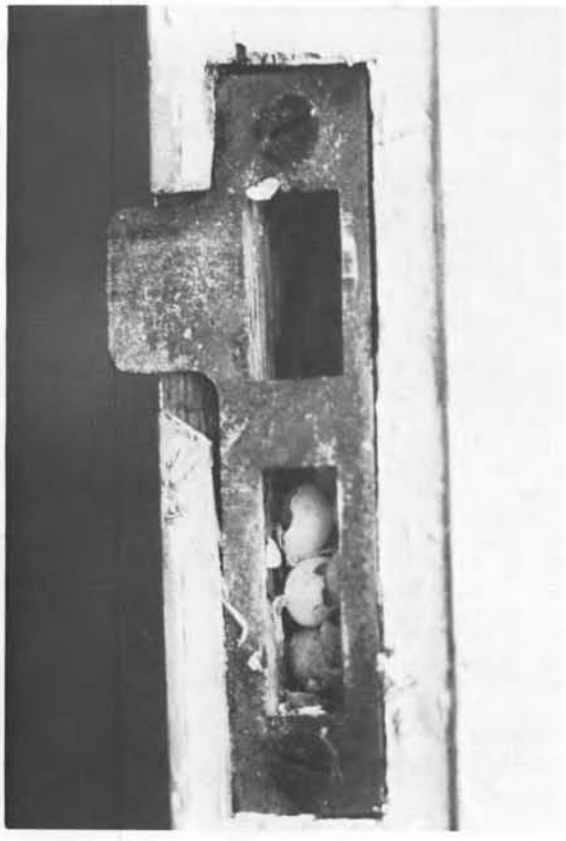

FIGURE 1. Communal nesting site of *Hemidactylus mabouia* in a door latch.

The writer used a binocular microscope with a micrometer eye-piece to measure a total of seven eggs from three different Carriacouan clutches. The long axes of the eggs ranged in length from 9.3 to 9.8 mm, x = 9.6 mm. The short axes were from 7.9 to 8.4 mm in length, x = 8.1 mm. Loveridge (1953) reported that the eggs of African *H. mabouia* ranged in size from 10 to 13 mm. Pienaar (1966) gave the size range as 10 to 12 mm.

A newly hatched *H. mabouia*, (GBP-C-4), from Carriacou had a snout-vent length of 21 mm and a total length of 40 mm. This is notably longer than newly hatched African specimens which measure 30 to 32 mm in total length (Pienaar, 1966). Data on four other juveniles of unknown age from Carriacou are presented in Table 1 for comparison.

REPORT ON THE SSAR-HL LAKE TEXOMA MEETING

The SSAR held its fifteenth annual meeting with the HERPETOLOGISTS' LEAGUE at the University of Oklahoma Biological Station at Lake Texoma on 13-17 August 1972. Cordial hosts, excellent facilities and a relaxed atmosphere made this well-attended meeting highly successful.

The Board of Directors met Sunday 13 August with Chairman C. J. McCoy presiding. Present for the Board meeting were Kraig K. Adler, Arden H. Brame, Jr., Herndon G. Dowling, Robert E. Gordon, J. P. Kennedy, Sherman Minton, Max A. Nickerson, Henri C. Seibert, James Vial, and George R. Zug. The Board moved to: (1) give Dr. Kennedy the okay to expand the JOURNAL OF HERPETOLOGY to four issues in 1973, (2) retire HERPETOLOGICAL REVIEW as a title and purchase from HISS six issues of a newsletter and four issues of Current Titles annually and (3) approve four conservation proposals. Reports from various SSAR committees were heard and budgetary items were discussed.

On Monday there was a meeting of the Committee on Joint Cooperation. The paper session began 8:30 AM Tuesday with Chairman McCoy calling the meeting to order. Welcoming addresses were made by Dr. Paul F. Sharp, President, University of Oklahoma, Dr. Loren G. Hill, Director, University of Oklahoma Biological Station, and Dr. Victor H. Hutchison, Chairman of the Zoology Department, University of Oklahoma. Paper sessions continued through Tuesday and Wednesday with Drs. Robert G. Webb, Albert P. Blair, M. J. Fouquette and James R. Dixon presiding over the sessions. A panel discussion on the "future of herpetology" preceded the business meeting on Wednesday. The members of the Joint Committee on Cooperation served as panelists.

Additional events included an art and photographic exhibit organized by Rick Purdue and a live display of amphibians and reptiles (especially Oklahoma species) arranged by Robert Ball and Jim Archie. Dr. Carpenter led a field trip to local sites of herpetological interest on Thursday.

Scheduled social events included a smoker Tuesday evening and a banquet Wednesday evening. At the latter Joseph T. Collins was presented an award for his many years of service to the society.

The SSAR thanks the University of Oklahoma, the Oklahoma Zoo, the local committee (Drs. Victor Hutchison, Charles Carpenter and Hobart Landreth), local committee assistants and Dr. Loren Hill and his staff for their many contributions which led to the success of this meeting.

Max A. Nickerson
Secretary

SSAR RESOLUTION NUMBER 1. SUPPORTING THE NATURE PROTECTION ACT AND THE ENDANGERED SPECIES ACT OF 1972

WHEREAS, enactment of a Nature Protection Act will protect endangered or rare species and subspecies of fish and wildlife from commercial exploitation and needless killing in the United States and its territories; and

WHEREAS, the Endangered Species Conservation Act of 1972 will extend such protection to species and subspecies that are "likely within the foreseeable future to become threatened with extinction;" and

WHEREAS, the Society for the Study of Amphibians and Reptiles is an organization whose members are dedicated to the scientific study and conservation of amphibians and reptiles, and to the dissemination of knowledge about them; now, therefore

BE IT RESOLVED, that the Members of the Society for the Study of Amphibians and Reptiles meeting at Lake Texoma, Oklahoma, August 14, 1972, declare their full support for, and urge the passage of, the Nature Protection Act and the Endangered Species Conservation Act of 1972.

[SSAR Resolution Number 2 is essentially the same as ASIH Resolution No. 3, which was published in HERPETOL REV 4(4): 137. It is not repeated here.]

SSAR RESOLUTION NUMBER 3. FOR THE PROTECTION OF NORTH AMERICAN TORTOISES (Gopherus)

WHEREAS, the four species of the genus Gopherus (G. agassizi, G. berlandieri, G. flavomarginatus, G. polyphemus) are confined to the southern parts of the United States and northern Mexico, and are the only native North American tortoises; and

WHEREAS, the desert tortoise (G. agassizi) is protected by law in Arizona, California and Nevada; Berlandier's tortoise (G. berlandieri) is protected by law in Texas; and the State of Mississippi requires a special permit for non-resident persons to take gopher tortoises (G. polyphemus); and

WHEREAS, the Director, Departmento de Conservacion de la Fauna Silvestre, Mexico, reported to the Conservation Committee of the American Society of Ichthyologists and Herpetologists that according to the federal hunting laws of Mexico the collecting of tortoises in Mexico is unlawful without special authorization, which is seldom granted, and that authorities in northern Mexico have been notified so that they may

take more effective surveillance methods to check the exportation and sale of illegally taken tortoises; and

WHEREAS, the International Union for the Conservation of Nature and Natural Resources recognizes the desert tortoise (G. agassizi), Berlandieri's tortoise (G. berlandieri) and bolson tortoise (G. flavomarginatus) to be rare, endangered or depleted forms; and

WHEREAS, North American tortoises generally are unsuitable as pets since they seldom live long outside of their native habitat and usually slowly starve to death in captivity due to diets lacking in proper minerals and vitamins; and

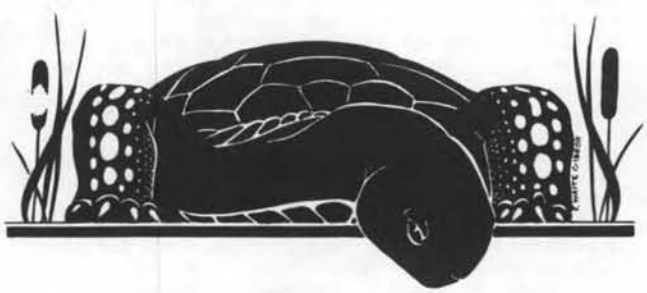
WHEREAS, the transfer of one species of Gopherus into the region of another, and with subsequent release into the wild, may lead to the decimation of native populations due to detrimental effects of competition for food and living space, hybrid sterility if interbreeding occurs, and introduction of new diseases and parasites; and

WHEREAS, there is a substantial and often illegal commercial business in the importation and sale of North American tortoises in the United States, and many of these animals die during transportation and storage by animal dealers; and

WHEREAS, there is a continuing depletion of these unique North American tortoises due to habitat destruction, needless killing, mortality on roads, collecting for pets, trading, and commercial exploitations; now, therefore,

BE IT RESOLVED, that the Society for the Study of Amphibians and Reptiles meeting at Lake Texoma, Oklahoma, August 14, 1972, urges the Secretary of the Interior of the United States and the Director of the Departmento de Conservacion de la Fauna Silvestre of Mexico to prohibit the importation or exportation of any species of North American tortoises (genus Gopherus) into or out of their countries, except for legitimate scientific, educational, and zoological display purposes; and

BE IT FURTHER RESOLVED, that this Society urges the Directors or Commissions of State Wildlife Departments and Agencies to undertake measures to insure the survival of native populations of North American tortoises, and to outlaw the sale, harming, collecting, and possession of any North American tortoise within their state boundaries, except for legitimate scientific, educational, and zoological display purposes; and



BE IT FURTHER RESOLVED, that copies of this resolution be sent to the Secretary of the Interior, the Director of the United States Fish and Wildlife Service, the Chief of the Office of Endangered Species, Directors and Commissions of State Wildlife Departments and Agencies, and the Director of the Departmento de Conservacion de la Fauna Silvestre, Mexico.

SSAR RESOLUTION NUMBER 4. THE IMPORTATION OF EXOTIC SPECIES

WHEREAS, certain species of amphibians and reptiles are capable of inflicting serious injury upon domestic animals and human beings; and

WHEREAS, the Society for the Study of Amphibians and Reptiles is an organization dedicated to the scientific study and conservation of amphibians and reptiles, and to the dissemination of knowledge about them; now, therefore,

BE IT RESOLVED, that the Society for the Study of Amphibians and Reptiles meeting at Lake Texoma, Oklahoma, August 14, 1972, urges the concerned agencies of the Federal Government and the fifty states to develop regulations prohibiting, except for legitimate scientific, educational, or zoological display purposes, the importation of amphibians and reptiles.

POSTDOCTORAL POSITION IN ANIMAL ORIENTATION

A postdoctoral position to study light receptors and mechanisms for orientation in amphibians and reptiles will be available for a 12-month period beginning September 1973. Current studies include the role of polarized light in orientation and the identification of extraoptic receptors, but candidates should provide a prospectus of their own research plans. Other details may be obtained from Dr. Kraig Adler, Section of Neurobiology and Behavior, Cornell University, Langmuir Laboratory, Ithaca, New York 14850.

AN IMPORTANT REPORT TO SSAR MEMBERS

As early as 1970 it was recognized by some officers of both organizations that the converging memberships, activities, and objectives of the Society for the Study of Amphibians and Reptiles (SSAR) and the Herpetologists' League (HL) were resulting in duplication of effort. The SSAR Board of Directors, at their 1970 meeting in Kansas City, decided to consider "closer cooperation, coordination, and possible amalgamation" with HL. At the 1970 AAAS meeting in Chicago a joint session of the SSAR Board and the HL Council was held. At this session the two organizations agreed to co-sponsor the annual meetings in 1971, and to hold a joint annual meeting in 1972. They also agreed to joint sponsorship of Herpetological Review. At this same meeting the two societies appointed members to a "Joint Committee on Cooperation," which was charged to consider the long-range objectives of cooperation between the societies, including the feasibility of amalgamation into one organization.

The Joint Committee on Cooperation held meetings at Albuquerque and Philadelphia during 1971, and circulated proposals, counter-proposals, memos, and reports. At the 1972 meeting at Lake Texoma the Joint Committee held its final meetings, and prepared a report based on the deliberations and investigations of the previous twenty months. This report was adopted unanimously by the members of the Joint Committee, and accepted by the SSAR Board of Directors and the HL Executive Council.

The Joint Committee reported that amalgamation of the two societies into one is not feasible at the present time, but that economic conditions may eventually force reconsideration of the feasibility of amalgamation. The Joint Committee further recommended that the two organizations continue to pool efforts and cooperate in various areas, and that this cooperation should be directed by joint meetings of the governing bodies of the two societies.

The role of the Joint Committee, and its area of responsibility, have been widely misinterpreted by the members of both HL and SSAR. The Joint Committee was charged to study the objectives of long-range cooperation between the organizations. Although amalgamation certainly could be one means of consolidating our efforts, it is not the only means. Nevertheless, many members of SSAR had the idea that the Joint Committee was formed only to develop detailed plans for amalgamation. The Joint Committee report clearly approves and suggests increased cooperation and elimination of wasteful duplication, but without amalgamation at this time.

One of the most disappointing aspects of the Joint Committee's work was the lack of input from members of the societies. Repeated pleas for suggestions and opinions brought only a few letters, mostly from members with very strong feelings about the single question of amalgamation. This letter is another request for your help. The Board of Directors has accepted the report of the Joint Committee, but we must be responsive to the desires of the membership at large in implementing the recommendations of the committee. I ask you to consider carefully the three alternatives facing SSAR, as outlined below. Make your own judgement, and please respond by marking and returning the attached sheet. Your response will determine the future of our society.

Sincerely,

C. J. McCoy, Chairman

The Alternatives

(1) Separation. The societies would remain separate entities, with separate governing bodies, but with no formal provision for exchange, communication, or cooperation. This arrangement provides maximum freedom for independent development, but risks maximum inefficiency and duplication of effort.

(2) Amalgamation. Complete merger of the organizations would produce a single society with enlarged membership (not double either HL or SSAR). Diversity of approach and potential for divergent development would be halved, but planning and objectives could be unified. The cost of membership would not be reduced, since both organizations now maximize services by extensive reliance on contributed services of officers ("hidden costs"). Membership dues translate directly into services (publications, etc.), and a reduction in dues could be achieved only by reduction of services. Contributed services might be more difficult to obtain with the increased work-load in a larger organization, thus "hidden costs" could become real costs, but some population-dependent costs (such as printing) might be reduced. Duplication in governing bodies would be eliminated, but the chance for an individual to serve a society would be reduced. Competition in publications would be avoided, but diversity of editorial approach would suffer. Organizational problems could be reduced, but flexibility and responsiveness might be sacrificed.

(3) Cooperation. Each organization would retain independence and potential for divergent development, but some (not all) duplication of effort could be eliminated. The organizations could cooperate on matters of mutual interest (public affairs, meetings, etc.), but remain responsive to their own memberships. Members could be given a united voice in matters of general interest, but still could serve the single organization whose philosophy best suited their personal objectives. Population-dependent costs would not be reduced, but contributed services could be maximized. Diversity of publications and editorial policy could be preserved.

An Analysis

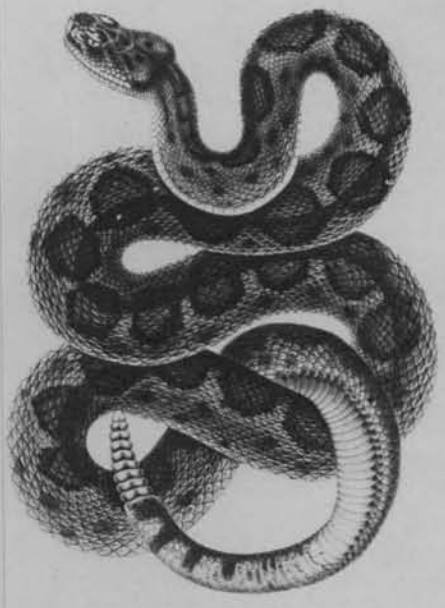
The following comparison of the possible benefits of the three alternatives was developed during the Joint Committee deliberations. It does not represent a consensus of the Joint Committee members, nor of the Board of Directors of SSAR, but it may be useful to you in evaluating the alternatives.

	(1)Separation	(2)Amalgamation	(3)Cooperation
Organization			
1. maximizes opportunity for contribution of services	best	least	next best
2. eliminates duplication	least	best	next best
3. permits unified approach to herpetological problems	least	best	next best
4. permits greater concensus for action	best	least	next best
5. maximizes efficiency	least	best	next best
6. permits individual initiative to promote specific program	best	least	next best
7. opportunity for individual participation	best	least	next best
8. maximizes flexibility in policy	best	least	next best
9. promotes diversity	best	least	next best
Individuals			
1. choice of programs greater	best	least	next best
2. has greater say in societal operations	best	least	next best
3. maximum choice of meeting to attend	best	least	next best
4. voice in national matters is enhanced	least	best	next best
5. opinion on given issue is enhanced	best	least	next best
6. convenience in dealing with professional societies is enhanced	least	best	least
7. benefits from economic competition	best	least	next best

A POLL OF S S A R MEMBERS

(See overleaf)

	(1)Separation	(2)Amalgamation	(3)Cooperation
Economic			
1. population-dependent costs are best served	least	best	next best
2. stability best attained	least	best	next best
3. pooled assets maximized	least	best	n. a.
4. competition eliminated	least	best	next best
5. cost of meetings factor	least	best	next best
6. ability to provide multitude of services while maximizing hidden cost is served	next best	least	best
Publications			
1. will permit diversity of policy in journal	best	least	next best
2. greater economy of production	least	best	n. a.
3. maximize institutional subscriptions, distribution, etc.	least	best	n. a.
4. will permit diversity of type of publication	best	least	n. a.
5. maximum efficiency of operations (mailing lists, billing, etc.)	least	best	n. a.
6. will reach quality levels	least	best	n. a.



Return to: C. J. McCoy, Chairman
Society for the Study of Amphibians and Reptiles

Check here ( ) if you are also a member of the Herpetologists' League.

Bulletin of the ANTIVENIN INSTITUTE of AMERICA

Complete set: volumes 1-5, originally published in Philadelphia, 1927-1932
About 575 pages (measuring 8 1/2 by 11 inches); 163 photographs; maps; index

THIS SERIES is an important journal devoted primarily to venomous animals; it has been out-of-print for many years and is now virtually unobtainable. The subject matter covers taxonomy, biology and geographical distribution of species, especially of the Americas; the economic and public health aspects of the snake-bite problem; the collection of venoms, their composition, properties and physiological effects; and the production of antivenin. Although most of the articles are on the biology of poisonous and non-poisonous snakes, there are others on lizards, salamanders and crocodilians, as well as some historical notes and information on the care of reptiles in captivity. Most articles are of interest both to professionals and to amateurs.

The list of authors includes the most prominent herpetologists and students of venomous animals of the day. Those most frequently included are Afranio do Amaral, Thomas Barbour, Frank N. Blanchard, Roger Conant, Raymond L. Ditmars, Emmett R. Dunn, Laurence M. Klauber, Arthur Loveridge, Douglas D. H. March, Karl P. Schmidt and Grace Olive Wiley, but also Harold L. Babcock, F. W. FitzSimons, W. Gardner Lynn, Robert Mertens, M. Graham Netting, R. Marlin Perkins, C. Picado-T., Olive G. Stull, J. Vellard, Gordon L. Walls and F. Werner.

Please mark these boxes if you want information on SSAR membership ☐ or a complete list of Society publications ☐.

HERPETOLOGISTS' LEAGUE

PUBLISHERS OF

HERPETOLOGICA

HERPETOLOGICA, the official scientific journal of the Herpetologists' League, is international in scope and open to articles on various aspects of amphibians and reptiles. It is now issued quarterly in March, June, September and December. The table of contents and index for the year's volume is contained in the December issue (except for volumes 1 through 6).

Complete sets of HERPETOLOGICA are available:

- Volume 1, 1936-1940; $1.50 per issue numbers 1, 2, 3, 4, 5, 6, 7 and 8 per volume $ 12.00
- Volume 2, 1940-1945; $1.50 per issue numbers 1, 2, 3, 4, 5, 6, and 7-8 (one issue) 10.50
- Volume 3, 1945-1947; $1.50 per issue numbers 1, 2, 3, 4, 5 and 6 9.00
- Volume 4, 1947-1948; $1.50 per issue numbers 1, 2, 3, 4, 5 and 6; supplements 1, 2 12.00
- Volume 5, 1949; $1.50 per issue numbers 1, 2, 3, 4, 5 and 6; supplements 1, 2 12.00
- Volume 6, 1950; $1.50 per issue numbers 1, 2, 3, 4, 5, 6 and 7 10.50
- Volume 7, 1951; $1.25 per issue numbers 1, 2, 3 and 4 5.00
- Volume 8, 1952; $1.25 per issue numbers 1, 2, 3 and 4 5.00
- Volume 9, 1953; $1.25 per issue numbers 1, 2, 3 and 4 5.00
- Volume 10, 1954; $1.75 per issue numbers 1, 2 and 3 7.50
- Volume 11, 1955; $1.75 per issue numbers 1, 2 and 3 7.50
- Volume 12, 1956; $1.25 per issue numbers 1, 2, 3 and 4 5.00
- Volume 13, 1957-1958; $1.25 per issue numbers 1, 2, 3 and 4 5.00
- Volume 14, 1958; $1.25 per issue numbers 1, 2, 3 and 4 5.00
- Volume 15, 1959; $1.25 per issue numbers 1, 2, 3 and 4 5.00
- Volume 16, 1960; $1.25 per issue numbers 1, 2, 3 and 4 5.00
- Volume 17, 1961-1962; $1.25 per issue numbers 1, 2, 3 and 4 5.00
- Volume 18, 1962-1963; $1.25 per issue numbers 1, 2, 3 and 4 5.00
- Volume 19, 1963-1964; $2.00 per issue numbers 1, 2, 3 and 4 8.00
- Volume 20, 1964-1965; $2.00 per issue numbers 1, 2, 3 and 4 8.00
- Volume 21, 1965; $2.00 per issue numbers 1, 2, 3 and 4 8.00
- Volume 22, 1966; $2.00 per issue numbers 1, 2, 3 and 4 per volume $ 8.00
- Volume 23, 1967; $2.00 per issue numbers 1, 2, 3 and 4 8.00
- Volume 24, 1968; $2.00 per issue numbers 1, 2, 3 and 4 8.00
- Volume 25, 1969; $2.00 per issue numbers 1, 2, 3 and 4 8.00
- Volume 26, 1970; $3.75 per issue numbers 1, 2, 3 and 4 15.00
- Volume 27, 1971; $3.75 per issue numbers 1, 2, 3 and 4 15.00
- Table of Contents and Index for Volumes 1 to 6; index free with whole volumes, or each $ 0.25

AUSTRALIAN ANURAN CHROMOSOME NUMBERS

David S. Woodruff

Following on the first description of an Australian anuran's karyotype (Robinson and Stephenson 1967) I determined the chromosome numbers of six other leptodactylids and a hylid from Victoria. Chromosome numbers were determined from colchicine-arrested squash preparations of larval tail-tips.

The leptodactylids (Limnodynastes tasmaniensis, Crinia signifera, C. victoriana, Pseudophryne bibroni, P. dendyi, P. semimarmorata) were found to have 12 pairs of chromosomes in the normal diploid set. Results for L. tasmaniensis, C. signifera, and P. bibroni confirm the findings of Ullerich (1967) and Moreschalchi et al. (1968). Chromosome complements have now been reported for 10 Australian leptodactylids, representing four of the 17 genera present in this region. 2N = 24 in all species studied and there are six pairs of large and six pairs of small, meta- or submetacentric, chromosomes. Despite overall similarity in chromosome numbers and morphology, detailed studies have revealed interspecific morphological variation, at least in Limnodynastes (Robinson and Stephenson 1967, Ullerich 1967). In contrast to the situation in Australia, none of the 72 Neotropical or African leptodactylids examined have a diploid number of 24 (Lynch 1971).

The hylid, Litoria ewingi, was found to have 13 pairs of chromosomes in the normal diploid set. Karyotypes of six other species of Litoria are known (Duellman 1967, Stephenson and Stephenson 1970). 2N = 26 in all but one Papuan species (L. angiana 2N = 30). Chromosome numbers of 36 other species of Hyla from Holarctic and Neotropic regions are summarized by Stephenson and Stephenson (1970): all but five species have a diploid number of 24. Thus, Tyler's (1971) resurrection of Litoria for the Australo-Papuan hylids previously referred to Hyla, is supported by the data on chromosome numbers.

This study was supported by an Australian Commonwealth Postgraduate Award. I thank Guy Bush and William Hall for technical advice and discussion.

CURRENT HERPETOLOGICAL TITLES, XXIII: 1971 - 1972

Herpetological Information Search Systems
American Museum of Natural History
New York, New York 10024

We have brought to your attention more than 20,000 current titles in the pages of this journal to date.

The titles of papers appearing in our lists were obtained by regular scanning of about 2500 journals directly and more than 1000 through secondary sources such as Chemical Abstracts Biochemical sections, Current Contents, publishers' catalogs, etc. Theses in English also appear, coming from such sources as Dissertation Abstracts and various academic publications. Abstracts of papers presented at various meetings and symposia are included. A complete list of the journals covered by us is published in Herpetol. Yearb. 1971. The coverage of books and theses in languages other than English is improving because a larger number of our colleagues bring those titles to our attention. Some copies have been mailed directly to us for inclusion in our lists. However, we would still appreciate being made aware of new books, reports, and non-English theses.

We realize that many of the titles listed are marginal to the field of herpetology as customarily defined. Many are published in journals of physiology, pharmacology, cytology, or embryology. Others are from medical journals, state fish and game publications, or pet animal journals. Thus, they are not aimed at an audience of herpetologists. All of them, however, deal in some way with amphibians and reptiles. As such, they may be of interest to at least some readers of HERPETOLOGICAL REVIEW. It seems better to let the reader make the selection from the list, rather than one of our small group deciding that this paper or that -- or this kind of paper -- is of no interest to anyone.

Our present policy, then, is to list the title of any current paper (e.g., 1971-1972) that is concerned with a member of a Recent order of amphibians or reptiles.

HERPETOLOGICAL REVIEW has appeared bimonthly, beginning in 1971. This means that the titles published here will be more current than the previous quarterly issues allowed.

Except for the omission of extinct orders, our list is comparable with that of the Amphibia and Reptilia sections of the Zoological Record, though ours is more comprehensive and considerably more current.

This list contains titles of books and articles that have come to our attention during the period 1 August 1972 through 30 September 1972. HR is computer printed and because of necessary production procedures there is a possibility that on occasion the titles from a single issue of a journal may appear in several issues of HR. Periodical title abbreviations follow the International List of Periodical Title Word Abbreviations (based on the Amer. Nat. Standards Comm. Z39.) (Chemical Abstracts Service, Columbus, Ohio, US.).

Acknowledgements. This list was prepared by the HISS staff: H. G. Dowling, I. Gilboa, I. Palser, and M. Coxe. J. A. Peters of the U. S. National Museum has continued to provide a welcome back-up program to our search of the literature, and G. J. Jacobs of NASA has kept us informed of the many publications and translations resulting from the United States space efforts. The library staff of the Museum have continued to aid our project. Special thanks to the members of the Herpetology Department, AMNH for their aid in cross indexing, which allows us to offer new services. We continue to rely on the advice and aid of James E. Bradley of the University of Rhode Island Computer Laboratory. We also wish to thank the many individuals who have sent us early copies of reprints for inclusion here.

This is contribution Number 46 of the Genera of Reptiles Project, which is supported by the Information Services Program of the National Science Foundation (NSF GN-707).

*H*ERPETOLOGICAL
*I*NFORMATION
*S*EARCH
*S*YSTEMS

With the addition of newsletters and current titles to its present stable of publications, HISS will provide a variety of services to the individual herpetologist in 1973. However, the cost of these services in subsequent years will be directly related to the number of INSTITUTIONAL subscriptions that we are able to obtain in the interim.

We urge each of you to ask your institution, library, or department (or all of these) to subscribe to one or more of the listed HISS publications. It is not necessary to use this form -- use any form -- but please make the request!

December 1972

TO:_____

Please place STANDING ORDERS, to begin in January 1973, for the indicated HISS publications. These are needed for the support of research activities and academic studies in this department.

Signed:_____

INSTITUTIONAL STANDING ORDER

	STANDING ORDER	PLEASE CHECK
HISS NEWS-JOURNAL The new newsletter for all herpetologists. Bimonthly. Annual subscription.....	$ 12.00	[ ]
HISS TITLES & REVIEWS The new literature alerting service for persons interested in amphibians and reptiles. Quarterly. Annual subscription...	$ 12.00	[ ]
HERPETOLOGISTS' YEARBOOK A new annual of almanac diversity on herpetology, herpetologists, and their publications.....	$ 15.00	[ ]
PUBLICATIONS IN HERPETOLOGY Specialized bibliographies in various subject-areas (see HR 4(2): 29). Each.....	$ 8.00	[ ]

BOOK REVIEW

ANFIBIOS DE NICARAGUA: INTRODUCCION A SU SISTEMATICA, VIDA Y COSTUMBRES. By Jaime Villa, 1972. Instituto Geografico Nacional y Banco Central de Nicaragua, Managua, Nicaragua. xii + 218 pp., 139 figs. (Available from Ralph Curtis Books, 2633 Adams Street, Hollywood, Florida 33020). $4.00.

The "darkest" portions of the Central American isthmus, with respect to the herpetofauna, lie in its approximate geographic center, viz., Nicaragua and Honduras. Nonetheless, much of zoogeographically important Nuclear Central America was comprised of what is now Nicaragua and Honduras. There are several reasons for this regrettable situation, but one important factor has been the lack, until recently, of workers committed to the study of the herpetofauna of these countries. The herpetofaunas of Guatemala, British Honduras, El Salvador, and Costa Rica have been treated in major works. Although a major work has yet to be published in Panama, there has been much more written on the herpetofauna of that country than for either Honduras or Nicaragua.

It is extremely heartening, therefore, to note the emergence of Villa's Anfibios de Nicaragua, the first of a series of works treating the lower vertebrates of this country. It is equally heartening to note that this is the first major herpetofaunal work on any country in Central America to be authored by a native of that country.

Anfibios de Nicaragua is intended by the author as a dual purpose book, first as a general introduction to the biology of Central American amphibians and secondly as a study of the Nicaraguan amphibians.

The book is divided into two major sections, an introduction treating various general aspects of the biology of Central American amphibians and accounts of the caecilians, salamanders, and anurans of Nicaragua. The introductory section contains information generally available elsewhere, but not in Spanish and not in a format likely to be easily obtainable in Nicaragua and other Central American schools. Thus this section should prove useful in biology courses in Central America.

Our interest, as students of the herpetofauna of the neighboring country of Honduras, is primarily in how well the second purpose has been fulfilled. Each of the 54 species currently known from Nicaragua is treated in varying detail. Spot distribution maps are provided for only 30 of those species, although Villa stated that only species with country-wide distributions were not mapped. This can hardly apply to the centrolenids and the Eleutherodactylus, none of which had their distributions mapped. A wide range in presentation of distributional data is evident, varying from species with no map or statement of Nicaraguan distribution (e.g., Centrolenella pulverata) to those with a spot map and a listing of specific Nicaraguan localities (e.g., Leptodactylus pentadactylus). In our opinion, inclusion of specific Nicaraguan localities for all species would have been valuable.

Perhaps this was deleted in the interest of shortening the book, but we feel that some information contained in the species accounts could have been deleted because it is available in published form elsewhere, so that room could have been made for locality records. For example, a long discussion of the confused taxonomic history of Rana maculata (=R. macroglossa auctorum) and the lists of recently published synonyms for some species (e.g., Eleutherodactylus bransfordi, Phrynohyas vendulosa, Smilisca baudinii) are out of place in this kind of work. Additional space would also have been gained by the deletion of published descriptions of individuals of certain species (e.g., all Centrolenella). This information could have been presented in a shortened fashion consistent with that given for other species.

A useful addition to the work would have been a gazetteer of herpetological localities in this little-known country. Another major contribution would have been a section dealing with the vegetation or ecological zones of that country, as reference was frequently made to these zones in distributional statements and this information is difficult to find elsewhere.

A final point of criticism relates to the lack of order of presentation of data in the species accounts. Villa stated in his introduction that he felt that varying the order would improve readability, but in terms of both readability and usability we feel that a standardized approach would have been more appropriate.

On the balance, we are happy to see this discussion of the known amphibian fauna of Nicaragua, along with the keys for identification and the generally good illustrations, and we are looking forward to the appearance of the other works in this series.

HERPETOLOGISTS' LEAGUE

All persons interested in herpetology are eligible for membership.

Members receive HERPETOLOGICA (4 issues/year), HISS NEWS - JOURNAL (6 issues/year), and HISS TITLES & REVIEWS (5 issues/year). They may submit manuscripts for publication in all these journals, and may present papers at the League's Annual Meeting.

HERPETOLOGICA has been published regularly since 1936. All back issues are available(see ad, p. "D").

Member..... $8.00

Fellow (elected).....$10.00

INSTITUTIONAL SUBSCRIPTION to HERPETOLOGICA.....$15.00

CLASSIFIED ADVERTISING IN H I S S PUBLICATIONS

New "Classified" sections will be opened in the three new HISS publications (see descriptions on page 209).

The cost will be 30¢ per word, with a minimum of $3.00 per insertion. A 20% reduction is allowed for multiple insertions.

P A G E C H A R G E S AND REPRINTS OF HISS PUBLICATIONS

Authors of articles or reports submitted to H R are asked to contribute toward their publication costs to the extent of $20 per page. This payment is not a prerequisite to publication. However, paid articles receive priority and are likely to appear earlier than others.

Page-charge payments entitle the author to 100 reprints (or tear-sheets) without additional charge. [Additional reprints may be purchased at $5/page/per 100 copies.]

Cost-sharing of this kind allows additional publication without increasing publication costs to subscribers. It is, thus, a method of holding subscription rates at their present levels.

SOCIETY FOR THE STUDY OF AMPHIBIANS AND REPTILES

Membership is open to anyone who is interested in amphibians and reptiles.

Members have voting privileges in the Society. They receive the JOURNAL OF HERPETOLOGY (3-4 issues/year), HISS NEWS - JOURNAL (6 issues/year), HISS TITLES & REVIEWS (5 issues/year), and FACSIMILE REPRINTS IN HERPETOLOGY (2-3 issues/year). They may purchase other Society publications at reduced rates.

OCTOBER 1972

SOCIETY FOR THE STUDY OF AMPHIBIANS AND REPTILES

The Society was founded in 1958 as the OHIO HERPETOLOGICAL SOCIETY. Following rapid growth of membership and expansion of operations, the organization became the SOCIETY FOR THE STUDY OF AMPHIBIANS AND REPTILES in 1967.

The SSAR encourages the acquisition of knowledge on amphibians and reptiles, and the dissemination of scientific information of these animals. It encourages the conservation of wildlife in general, and of amphibians and reptiles in particular. A major effort is made to achieve closer cooperation and effective communication between amateur and professional workers. (See Third Cover for membership information.)

HERPETOLOGISTS

LEAGUE

The Herpetologists' League is an international organization which was established in 1936 by Major Chapman Grant. It is dedicated to furthering knowledge of the biology of amphibians and reptiles.

In 1971 it had 900 members and fellows (including Life and Honorary members), and more than 400 institutional subscriptions to its journal, HERPETOLOGICA, which has been published continuously since 1936.

All persons interested in herpetology are eligible for membership. (See Third Cover for membership information.)

H I S S GIVEN MAJOR ROLE BY HERPETOLOGICAL SOCIETIES

Among the various activities of the Lake Texoma meeting -- administrative, social, and scientific -- were two key decisions that changed the status of HISS, perhaps for all time.

1. The Board of the SSAR decided to discontinue publication of HERPETOLOGICAL REVIEW, in favor of a newsletter for the entire herpetological community which is to be published by HISS. At the same time it voted sufficient funds to HISS to assure that SSAR members would receive the same services from HISS publications that they have from HERPETOLOGICAL REVIEW.
2. Subsequent to the SSAR action, the Council of the Herpetologists' League voted equivalent funds to HISS, to provide its members with these services.

In a sense, then, HISS has been given the ball and told to run with it. The $11,400 voted by the two societies make up only a minor part of HISS's current budget. And, with both societies digging into their reserves to provide even this minimum amount, it is obviously only a one-year solution for them. Neither society can support both its own journal plus the newsletter and current titles from current income.

However, with this strong indication of support from the herpetological community, HISS's chances of obtaining other funds are considerably improved. We are making an all-out effort to find full support for HISS services in 1973 and beyond. We must depend on society members to aid us in this search.

In addition to its present issues of PUBLICATIONS IN HERPETOLOGY and the HERPETOLOGISTS' YEARBOOK, HISS will issue two new publications to satisfy these new society demands:

HISS: NEWS will continue and expand on the news and information format that we have developed in HERPETOLOGICAL REVIEW over the last several years. This newsletter will continue to appear bimonthly.

HISS: TITLES will expand the literature alerting service of "Current Herpetological Titles" by a new section on "New Titles in Herpetological Journals" and an expanded section on new books and reviews. Four or five "Titles" issues are planned, depending on the volume of current literature.

We wish to emphasize that individual members of SSAR and H L will receive BOTH publications of this expanded service (ten or more issues) at no additional cost in 1973. However, we must count on new institutional subscriptions to make up a major part of the difference between the amount received from the two societies and the actual costs of production.

THEREFORE, WE URGE EVERY MEMBER TO ASK HIS INSTITUTION NOW TO SUBSCRIBE TO THE VARIOUS H I S S PUBLICATIONS. -- HGD.

(N.B. Information on subscriptions will be found on page 174; on SSAR and H L decisions, p. 160.)

CALENDAR 1972

22-26 November...III Congreso Nacional de Biologia & Symposium de Biologia Tropical Amazonica, Iquitos, Peru.

28-29 December....HERPETOLOGISTS' LEAGUE, Annual Meeting (Cosponsored by the SSAR), Washington, D.C.

CALENDAR 1973

24-30 June....AMERICAN SOCIETY OF ICHTHYOLOGISTS AND HERPETOLOGISTS, Annual Meeting, San Jose, Costa Rica.

4-11 August....FIRST INTERNATIONAL CONGRESS OF SYSTEMATIC AND EVOLUTIONARY BIOLOGY, Boulder, Colorado.

SUPPORT FOR H I S S GREATLY APPRECIATED

HISS has received a large number of letters supporting its activities, and some checks to aid its deficit budget during the current year. Persons, referring to our various notices, have indicated that they are willing to spend from $5 to $25 additional in the coming year, to continue to receive "Current Herpetological Titles."

The actions of the two herpetological societies (p. 160) have meant that SSAR and H L members will NOT have to pay extra for this service in 1973. Subsequent years are still in doubt, however, and will be determined to a considerable degree by how successful HISS is in selling its products to other individuals and institutions. Institutions (other than NSF) so far have contributed little to HISS's budget. We are asking, therefore, that all our supporters help us in gaining this essential support by recommending institutional subscriptions to our publications (p. 174).

Our utmost gratitude for the support that you have already given. -- HGD.

FINAL REPORT
JOINT COMMITTEE ON COOPERATION
HERPETOLOGISTS' LEAGUE AND SOCIETY FOR THE
STUDY OF AMPHIBIANS AND REPTILES

At the joint meeting of the two societies at Lake Texoma on 16 August 1972 the following recommendations were submitted to the governing bodies:

1. Merger is not practical at present.

2. However, in the opinion of the committee, if the two societies continue as separate entities financial exigencies may appear, in one or both societies, which will force reconsideration of this posture.

3. Therefore, we recommend that joint cooperative actions might continue.

4. The committee offers for consideration the following:
   a. A joint annual meeting.
   b. Joint meeting(s) of administrative committees.
   c. Establishment of joint committees to facilitate concerted action and to optimize society resources (money and time) in such areas as conservation, publication, cooperation with regional societies, information services, etc. Specifically, we recommend that the two governing bodies of the societies arrange to meet jointly at annual meetings.

5. Finally, the committee recognizes that the governing body of each society must act on this report individually, but we strongly urge that a joint session of the two bodies be called upon at the earliest opportunity to consider the above recommendations.

Representing the SSAR	Representing the HL
ROBERT E. GORDON	WILMER W. TANNER
KRAIG ADLER	HOBART F. LANDRETH
HERNDON G. DOWLING	CLARENCE J. McCOY
HENRI C. SEIBERT	VICTOR H. HUTCHISON,

N.B. Item #6 in the report of the SSAR Business Meeting (p. 162) is pertinent to this report.

"Of the 791 members of the SOCIETY FOR THE STUDY OF AMPHIBIANS AND REPTILES and the 885 members of the HERPETOLOGISTS' LEAGUE, 484 are held in common.

Thus, 61 per cent of SSAR members belong to the H L, and 55 per cent of H L members belong to the SSAR." [From a paper given at the Lake Texoma meeting by I. Gilboa & H. G. Dowling.]

NOW WHICH WAY ?

INTERIM MEETING OF THE EXECUTIVE COUNCIL THE HERPETOLOGISTS' LEAGUE

Nine of the thirteen members of the Executive Council of the Herpetologists' League attended the meetings at Lake Texoma. Inasmuch as this constituted a quorum it was possible to meet and take action on several important issues.

The Society for the Study of Amphibians and Reptiles has relinquished its control of HERPETOLOGICAL REVIEW to Herpetological Information Search Systems in order to allow HISS greater control in promoting this newsletter. It has agreed to increase its support of this organ for another year. The Herpetologists' League also has contributed funds for the support of this newsletter and your Council voted to continue this support, matching funds that the SSAR will contribute, for one additional year. The funds for this support will not come from our current budget, but will be drawn from our Reserve fund.

The editor of HERPETOLOGICA, Ronald Altig, has resigned; but we were fortunate in finding a well-qualified replacement, Dr. Crawford G. Jackson, Jr., from a nearby sister institution, Mississippi State College, at Columbus. The Council voted to accept Jackson's offer to take over the editorial duties. It expressed regret for Altig's resignation, and appreciation for his fine work in editing HERPETOLOGICA.

Dr. Hobart F. Landreth, your Secretary-Treasurer also has submitted his resignation which, with regret, the Council accepted. The names of several fine candidates are available and a selection will be made shortly of a man to replace him.

The American Association for the Advancement of Science, with whom we have been affiliated for many years, has decided that it can no longer subsidize the costs of the annual meetings of specialized affiliated societies. Rather than raising registration fees it decided to charge for room rental, projectionists, page costs in the program, etc. These charges are excessive. The American Society of Zoologists and the Society for the Study of Evolution also are involved and have decided to meet separately after this year. They have asked us to join them at Houston, Texas, in 1973. The League Council and the Board of Directors of the SSAR are forming a joint Meetings Planning Committee who will consider this invitation. In the meantime we will meet in Washington on December 28-29 as originally planned, but not with the AAAS.

T. P. Maslin, President

SSAR CHAIRMAN'S REPORT

During the past four years you have received the society newsletter, HERPETOLOGICAL REVIEW including a bibliographic insert CURRENT TITLES. Both HERPETOLOGICAL REVIEW and CURRENT TITLES have been produced for the society by HISS, an NSF-funded herpetological information service based at the American Museum of Natural History. SSAR, with help from the Herpetologists' League, has been paying for production of HERPETOLOGICAL REVIEW and the printing of CURRENT TITLES, but the cost of preparing CURRENT TITLES has been contributed by HISS and supported by NSF grant funds.

Early in 1971 we learned that the NSF support that has given us CURRENT TITLES at minimal cost would not continue beyond 1972. We have also been aware that the society could not pay for the preparation of CURRENT TITLES without a substantial increase in membership dues and subscription rates. Despite this difficult situation, the SSAR Board of Directors has acted to maintain these valuable services to the members of the society through 1973.

Starting in January the production of a herpetological community newsletter will be taken over entirely by HISS. This new publication will provide essentially the same services as HERPETOLOGICAL REVIEW, but it will not be an official publication of SSAR. Members of the society will receive six issues of this newsletter in 1973, along with four issues of CURRENT TITLES. In order to purchase these services for SSAR members through 1973 the board has authorized expenditures from the society's cash reserve.

The board had two primary motives in making this unusual decision. First, we are anxious to maintain the innovative and useful services to members that have made SSAR strong. Second, the board wanted to offer HISS the greatest possible chance for survival. The freedom offered HISS under this arrangement should make it easier for the project to broaden its base of support and to develop new sources of revenue to replace NSF funding.

Obviously it will be impossible to continue this arrangement beyond 1973, so I ask the members of SSAR to follow the lead of the board in offering every possible means of support for the irreplaceable HISS project at this crucial time in its history.

C. J. McCoy, Chairman

SSAR - BUSINESS MEETING

University of Oklahoma Biological Station
Lake Texoma, Oklahoma
16 August 1972

Dr. C. J. McCoy (Chairman) called the meeting to order at 5:35 P.M.

1. Report from the SSAR Board of Directors meeting.

   A. Three issues of the Journal of Herpetology will be issued in 1972 and Dr. Kennedy was given the okay to expand it to four issues in 1973.

   B. Two large facsimiles will appear in 1972:

      (1) Dunn: Salamanders of the Family Plethodontidae (In Press)
      (2) Fitzinger: Systema Reptilium (near submission)

      In 1973 the Bulletin of the American Antivenin Institute will be offered as a large facsimile.

   C. Two additional small facsimiles will appear in 1972:

      (1) Boulenger: Part 15
      (2) Boulenger: Part 16

   D. The SSAR-Board decided to retire HERPETOLOGICAL REVIEW as a title and to purchase from HISS six issues of a newsletter and four issues of Current Titles annually.

2. Two bylaw items proposed in Albuquerque and not considered at Philadelphia were presented for discussion:

   A. To provide visibility and appropriate representation for the Editor of the Catalogue of American Amphibians and Reptiles, it is proposed that:

      Article II, Section 4, item d shall become Article II, Section 4, item e, and...a new item d shall be inserted to read: The Editor of the Catalogue of American Amphibians and Reptiles shall be responsible for all phases of the publication of the Catalogue. He may appoint staff members to assist him. He shall report annually to the Board to whom he is responsible.

   B. To permit the Secretary more time for election preparation etc., it is proposed that:

      Article IX, Section 4 be changed as follows: "within one month" shall be changed to "within three months."

      Motion #1

      Dr. Duellman moved and Dr. Minton seconded a motion to accept the Board of Directors report. Passed.

3. The Nominating Committee reported the slate of Candidates for 1973.

   A. Dr. Henri Seibert (Treasurer) and Dr. Max A. Nickerson (Secretary) were presented unopposed.

   B. Candidates for Chairman-Elect are:

      Dr. James R. Dixon
      Dr. George Zug

   C. For the Board of Directors:

      (1) Slate 1
          Mr. Ray Pawley
          Mr. Mal Skaroff

      (2) Slate 2
          Dr. William Pyburn
          Dr. Philip Smith
          Dr. John Wright

   D. Nominations from the floor were accepted and Dr. Adler moved that Mr. John Applegarth be added to Slate 1. This was seconded by Dr. Nickerson. Passed.

      Dr. Seibert moved that nominations be closed. Dr. Duellman seconded and the motion passed.

4. Four conservation resolutions from the Conservation Committee were presented.

These (1) indicated the Society's support of the Nature Protection Act and the Endangered Species Conservation Act of 1972; (2) affirmed the professional responsibility of herpetologists; (3) supported the protection of North American tortoises (Gopherus); and (4) opposed the wholesale importation of amphibians and reptiles.

Resolution #2 is essentially the same as the ASIH Resolution #3, which was published in HERPETOL REV 4(4): 137. The text of the other resolutions will appear in the Conservation Section in this or future issues.

It was moved by Dr. Bury and seconded by Dr. Christensen that these resolutions be accepted. Passed.

5. Dr. Nickerson delivered the following statement of gratitude:

The SSAR wishes to thank the University of Oklahoma, its President - Dr. Paul Sharp, the Host Committee - Dr. Victor Hutchison, Dr. Charles Carpenter and Dr. Hobart Landreth, the University of Oklahoma Biological Station, its Director - Dr. Loren Hill, his wife and staff, for providing the excellent facilities and organization enjoyed at this meeting. We commend the Committee Assistants: Alice Echelle, Diane Tucker, Paula Brooks, Gina Meneguzzi, Anthony Echelle, Robert Ball, Mike Christensen, Rich Purdue, Gus Engbretson, Peggy Engbretson, Mary Jo Engbretson, Jim Archie, Dale Tuttle, Gordon Henly, Ronald Gratz and Douglas Turney for a job well done. Their efficient and courteous manner contributed greatly to the success of all events. Our appreciation is extended to the Oklahoma City Zoological Park for supplying staff and transportation and to HISS for conducting a call for papers and providing abstracts. SSAR expresses its great gratitude for the highly creative and energetic efforts of our Past-Chairman - Dr. Robert Gordon and Retiring Directors - Dr. Sherman Minton and Dr. George Zug.

6. Dr. Duellman moved that the Board of Directors of SSAR propose to the Executive Council of Herpetologists League that the SSAR and HL merge into one society. The results of this proposal are to be made available as soon as possible and no later than the next annual meeting. The motion was seconded by Dr. Rossman. Passed 53 for - 20 against.

7. Dr. Maslin moved that the title of HERPETOLOGICAL REVIEW be released by SSAR and given to HISS. The motion was seconded by Mr. Larson. Passed.

The meeting was adjourned.

Respectfully submitted,
Max A. Nickerson
SSAR - Secretary

Snakes Alive

NEW YORK POST, THURSDAY, APRIL 13, 1972

ATLANTA (AP)—There are snakes all over the place at Claudine Jackson's home in southwest Atlanta.

She's found them in the grass, under bricks and discarded lumber and tin cans and in a concrete culvert—90 of them last week and 37 in the first three days this week.

"I've found three in my house," she said. "I don't put on my shoes in the morning without shaking them out first.

"I don't go into the back yard without a hoe."

Mrs. Jackson called Director Charlie Fleming of the State Museum, and in a 20-minute visit he caught 17—one garter snake, one gopher snake, one king snake and one hog snake. The rest were ground snakes. None was poisonous.

Fleming had no explanation for the abundance of snakes.

ZOO AND FIELD EQUIPMENT
FOR THE HERPETOLOGIST

AVAILABLE NOW:
- FIELD HOOKS
- BOA HOOKS
- CAGE HOOKS
- MINI HOOKS
- BAG STICKS
- ABS PLASTIC HIDING BOXES
- FECES SCOOPS
- SEXING PROBES

AVAILABLE SOON:
- MODULAR CAGES
- CLAMP STICKS
- PLASTIC WATER DISHES

Strong
Lightweight
Design Flexibility
Reasonably Priced

COMPLETE SPECIFICATIONS AVAILABLE ON REQUEST

the Finest in Titanium, Beryllium, Aluminum,
Magnesium, Stainless Steel, and Polycarbonate Plastic

FURMONT REPTILE HOOKS
1815 BAHAMA DR. SEABROOK, TX. 77586

BACK ISSUES OF HERPETOLOGICAL REVIEW

The SSAR Publications Secretary is pleased to announce that all back issues of HERPETOLOGICAL REVIEW are now available at the usual cost of $1.50 each.

MEETING

EASTERN SEABOARD HERPETOLOGICAL LEAGUE

TAKOMA PARK, MARYLAND

SUNDAY, 29 OCTOBER 1972 All Interested Are Invited!

12.30 - 1.15 PM - REGISTRATION, setting up of exhibits, program line-up: Entrance of Columbia Union College SCIENCE BUILDING (No. 6 on map). Lunch (all vegetarian) available at CUC Snack Shop in CAMPUS CENTER (No. 1 on map).

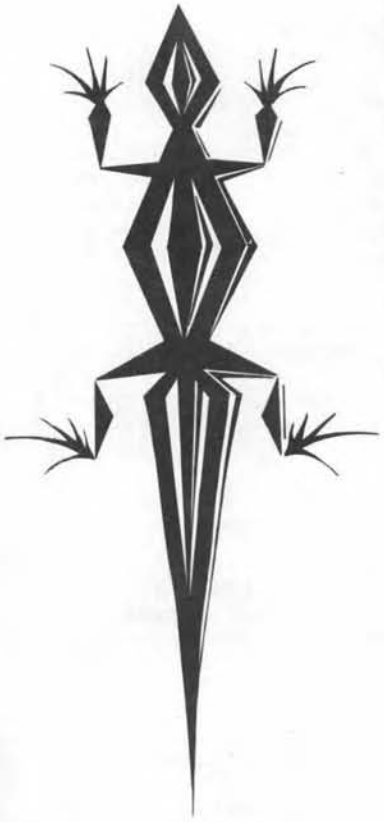
1.15 - 3.15 PM - FIRST SESSION in Science Amphitheater in SCIENCE BUILDING.

Introductory remarks by Dr. Lester E. Harris, Jr., Head, Department of Biology, Columbia Union College

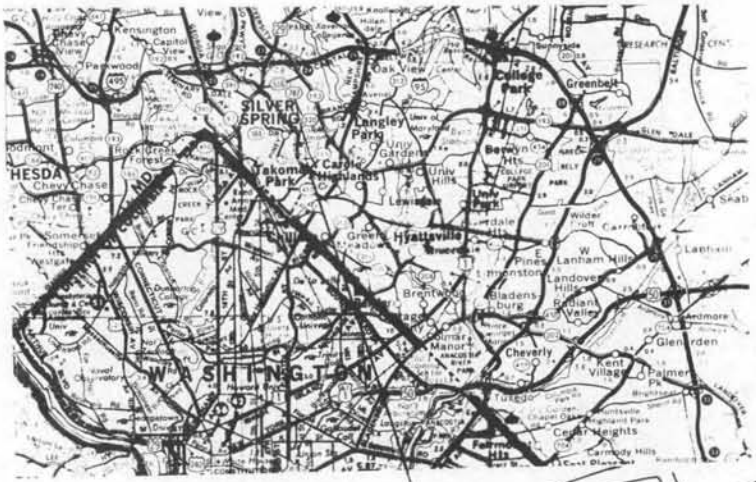
Keynote lecture by Dr. R. Bruce Bury, Chief, Herpetology Section, Bird and Mammal Laboratories, Bureau of Sport Fisheries, United States Department of the Interior

Various guest speakers and regional society representatives

3.15 - 4.00 PM - BREAK for examination of exhibits



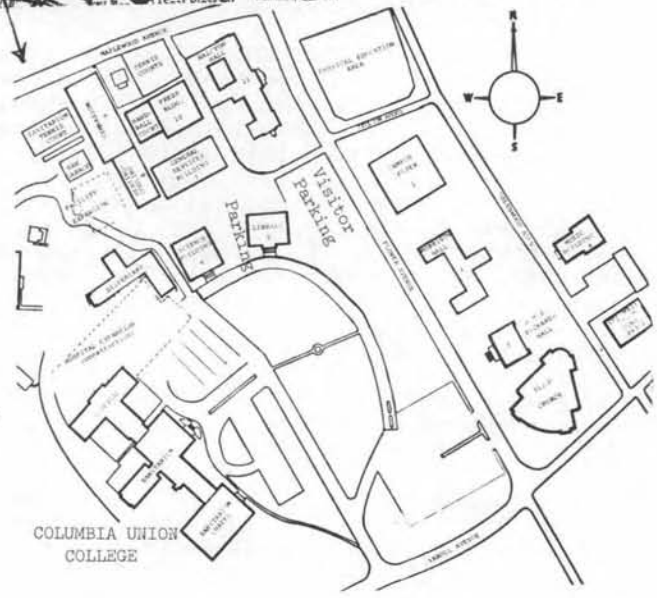
4.15 - 5.45 PM - SECOND SESSION in Science Amphitheater in SCIENCE BUILDING.



Various speakers from regional groups

(4.15 - 5.45 PM - Meeting of ESHL organizational representatives in Library of SCIENCE BUILDING to enact business)

6.00 PM - Adjourn for DINNER at Cafeteria (all vegetarian) in CAMPUS CENTER (Flat rate of $1.50 per person, no limit on servings)



(Cages, aquaria, etc., will be provided for housing live herps - NO POISONOUS SNAKES OR LIZARDS, please! Columbia Union College will provide 16mm and slide /"Carrousel"/ projectors. No smoking in buildings, please.)

DIRECTIONS TO COLUMBIA UNION COLLEGE [refer to Washington, DC, area road map]

Take Exit 25 South (New Hampshire Avenue) from Capital Beltway (I-495) to MD Route 410 (East-West Highway) at Takoma Park. Turn right onto East-West Highway. Cross County line into Montgomery County from Prince Georges County and proceed to traffic light. Carroll Avenue intersects East-West Highway obliquely from the right at this point. Turn right and continue on Carroll Avenue. The Washington Sanitarium, which is indicated on most area road maps, will be on the left shortly before Carroll Avenue intersects Flower Avenue. A major landmark at the intersection is the large, domed church. Turn left. There will be plenty of visitors' parking across street from Campus Center building.

For information, contact Bob Tuck, Coördinator, ESHL, 5431 - 56th Ave., #3, Riverdale, MD 20840 [301-927-7171], or Margaret Thomas, Secretary, ESHL, 1611 - 31st Street, N.W., #104, Washington, DC 20007 [202-338-7389].

HERPETOLOGICA REVIEWERS

The Editor and Editorial Board of Herpetologica gratefully acknowledge the assistance of the following people who have assisted in the review of manuscripts for Volume 28; possible deletions are accidental and these people are thanked anonymously in advance!

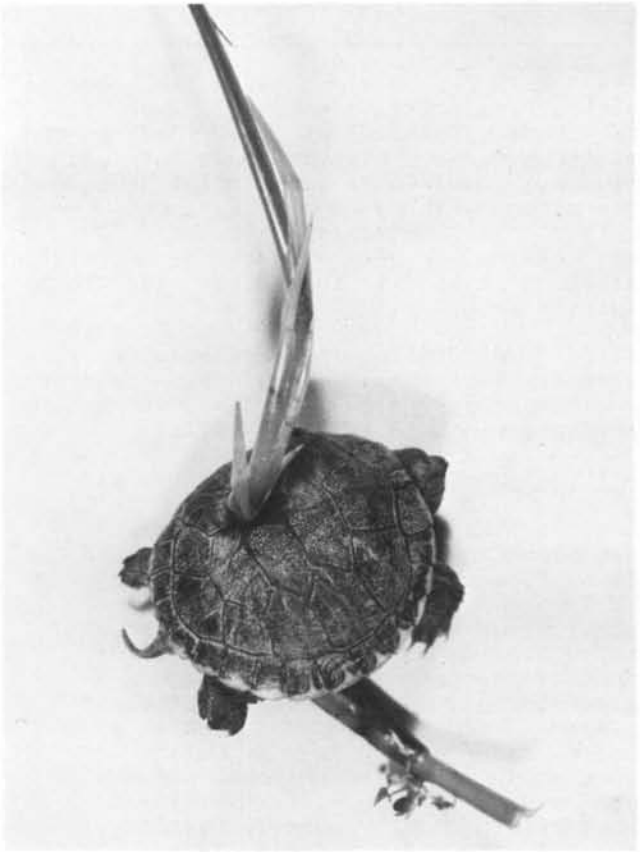
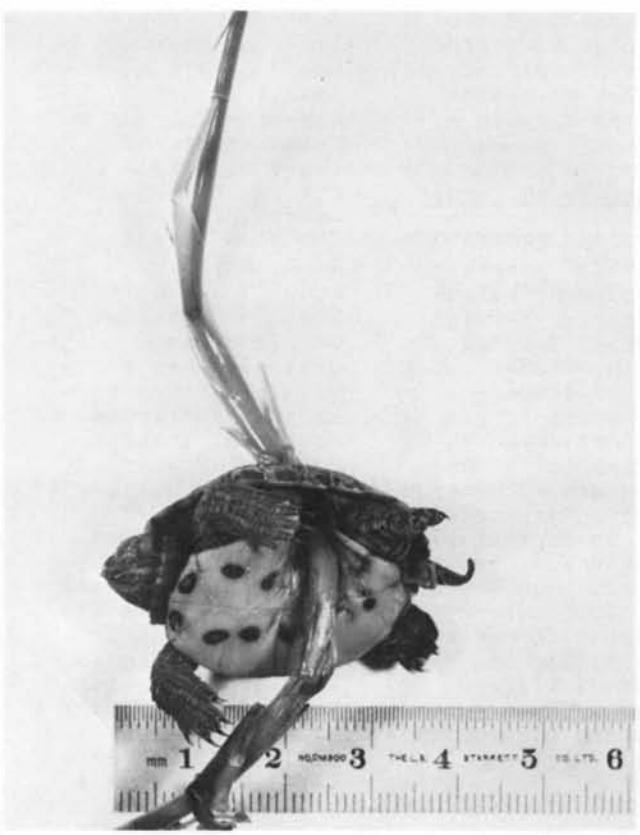
MEMBERS' DESIDERATA

GERALD KEOWN (P.O. Box 267, Alice, Texas 78331) is working on a study of the geographic distribution of Texas reptiles and would like to have any available county checklists from this area, as well as any other distribution data on a county by county basis. He is also interested in purchasing, for the cost of duplication, 35 mm. color slides of North American reptiles.

JOHN G. NEW (Dept. Biology, State University College, Oneonta, N.Y. 13820) for sale: Herpetologica Vols 1-28 (1-25 bound) $210 plus postage.



GRASS SPROUT GROWS THROUGH EMBRYO OF YELLOW-BELLIED TURTLE (*Chrysemys scripta*



Frank J. Turkowski

On 18 September 1947 a yellow-bellied turtle (*Chrysemys scripta*) nest was uncovered by a plow near Long Island, Back Bay Refuge, Virginia. A sprout of beardgrass (*Andropogon* sp.) had grown through the plastron of one developing turtle and emerged through the carapace. Though other external features appeared normal, shields were deformed where the grass had entered ventrally between the left abdominal and femoral scutes and emerged between the junction of the left third vertebral and second and third costals. The nest was disturbed greatly but apparently the specimen had hatched as there were no adhering egg remains. To my knowledge this is the first deformity reported due to direct contact of vegetation on a yellow-bellied turtle embryo.

I am grateful to Ross K. Watkins for the photographs and to Carl Simmons for providing the specimen which is in the Arizona State University Herpetological Museum.

SSAR CONTRIBUTORS

The SSAR is always happy to receive contributions from its members. Over $2000 have been donated by contributing and sustaining members over the past two years, including some rather substantial donations whose donors wish to remain anonymous. More important than the money, however, is the warm feeling of approval of the Society's activities that is indicated by these voluntary acts.

Since we failed to acknowledge this generosity last year, we now take pleasure in indicating with an * those who contributed both in 1971 and 1972.

HERPETOLOGY AT INDIANA UNIVERSITY

Work with amphibians and reptiles at Indiana University involves both field studies of ecology and evolution and laboratory analyses of development. Professor Craig E. Nelson serves as advisor for the field studies. His current work includes studies of the systematics of New World Microhylidae, of hybridization as an indicator of interspecific affinities in Ambystoma, and of the relationships between niche breadth, phylogenetic distance and genetic variability in the anuran community at the Boreceia field station of the University of Sao Paulo. Genetic variability analyses for the later project are being done by Dr. Sheldon I. Guttman of the Miami University of Ohio. Dr. Michael Ewert, a guest investigator, is studying "r" and "k" selection as reflected in geographic differences in turtle reproductive strategies.

Dr. J. Michael Jones has completed a study of evolutionary changes in the Bufo woodhousei and B. americanus populations near Bloomington which have occurred since A. P. Blair studied them in 1940. Dr. Jones has accepted a position with Emory and Henry College in Emory, Virginia. Mrs. Bonnie Walters completed a master's thesis on predatory interactions among pond breeding amphibians and is now living in San Luis Obispo, California.

Mr. P. Kelly Williams is concluding a study of the movements and population dynamics of 4 Ambystoma species which develop in the same pond. Mr. Michael Sabath has completed a study of some ecological aspects of gecko populations on Guam and is now devoting his efforts to a study of community structure in drosophid flies. Mr. Peter Hartz is currently pursuing studies on hybridization and isolating mechanisms in both naturally occurring and artificially produced sympatric areas between species of Hypopachus in Guatemala.

Indiana University maintains an axolotl colony (Ambystoma mexicanum) for experimental work in genetics and development. At present year-round spawning is being obtained. There are 32 mutants in stock. Professor R. R. Humphry is in charge of the axolotl colony and is continuing his work on mutant phenotypes and linkage. Mrs. Janice Brothers is Director of the axolotl colony and is responsible for colony maintenance. Professor John Sinclair continues work on DNA-RNA hybridization. Professors Robert Briggs and George Malacinski are investigating the molecular aspects of developmental mutants in the axolotl.

VARIATIONS IN THE FORM OF THE TRIGEMINAL FORAMEN IN SNAKES

Frances Waite Gibson

In snakes the maxillary and mandibular branches of the fifth cranial nerve, (V-2 and V-3), emerge from the prootic through the trigeminal foramen. The opening is separated by a bridge of bone into anterior and posterior foramina. This was long considered a constant feature.

In his general remarks on the anatomy of Serpents, Cope (1900: 689) stated "The trigeminus foramen is represented by two, which communicate beneath a long bridge in all snakes,...." Romer (1956: 128) made a similar statement. Neither Lakjer (1926) nor Hoffstetter (1939) mention any exception to this condition. McDowell (1967: 689) described the double trigeminal foramina as characteristic of alethinophidian (booid and colubroid) skulls and does not indicate any deviation from this pattern within this group. He further described the single foramen as typical of the scolecophidian skull (Typhlopidae, Leptotyphlopidae, and Anomalepidae). Underwood (1967: 1) used the double trigeminal foramina as a universal characteristic of snakes with the exception of Typhlops. Further (p. 101) in his generic description of Heterodon, Underwood stated: "The maxillary and mandibular branches of nerve V emerge through a common foramen, a very unusual condition" (see Fig. 1).

During recent studies several cases of variations in the form of the trigeminal foramen came to light. One of these was a Heterodon platyrhinos (AMNH 62590) skull which has a partial partition of the trigeminal foramen on the right side and a complete separation into anterior and posterior foramina on the left (Fig. 2). In eleven other specimens of Heterodon, however, all trigeminal foramina were single. Specimens examined were: five H. platyrhinos (AMNH 63590, 69647, 73805, 45035, and 106282); five H. nasicus (AMNH 58234, 74842, 87289, 87290, and a specimen with no data); and two H. simus (AMNH 99054 and 8343).

Other variations in the foramen within a genus occur in Trimeresurus, Bothrops and Xenodon. The foramen is usually double in Trimeresurus. However, skulls of T. albolabris (AMNH 27946) and T. wagleri (AMNH 4950) each exhibit the single condition on both sides. The foramen is usually divided in Bothrops, also, but B. atrox (AMNH 52937) has only partial separations on both sides. In Xenodon, two specimens (X. severus, AMNH 76573 and 62576) have single foramina while two specimens (X. merremi, AMNH 78970 and 35996) have double foramina.

A characteristic, by definition, is a distinguishing feature by which a group can be differentiated. In order to do this, it must be present in all members of that group. The variations of the trigeminal foramen point to an instability which makes it of doubtful value as a generic characteristic. Obviously, the double foramen cannot serve as a distinguishing feature of the Ophidia.

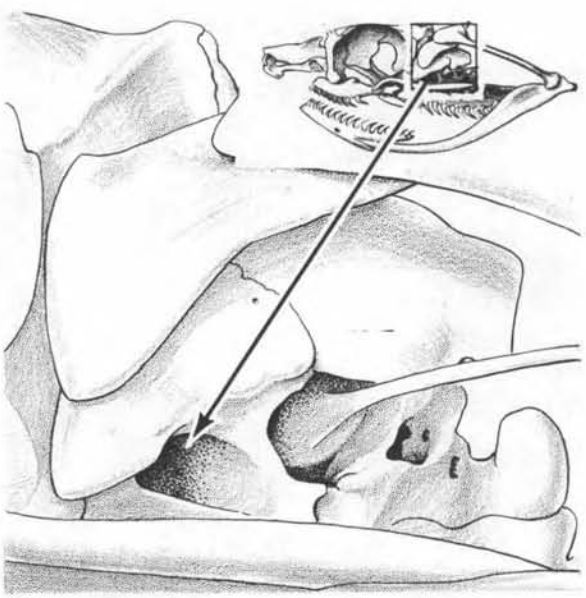

FIGURE 1. Heterodon platyrhinos (AMNH 69647) proötic region showing single trigeminal foramen.

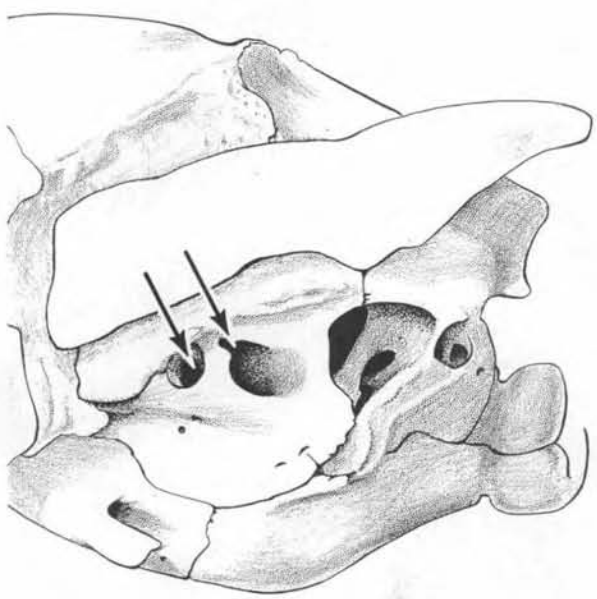

FIGURE 2. Heterodon platyrhinos (AMNH 63590) proötic region showing double trigeminal foramen. [Quadrate, ectopterygoid,and pterygoid removed.]

A BIBLIOGRAPHY OF TURTLE BEHAVIOR, INCLUDING REFERENCES TO ECOLOGY AND PHYSIOLOGY

Catalog of Selected Documents In Psychology, 1972, 72, 60. (Abstract)

Approximately 1,060 references pertaining to turtle behavior are listed with prefatory comments on additional sources. References that focus on paleontology, taxonomy, parasitology, collection site records, morphology, and anatomy have been generally excluded unless the reference included comments on behavior. Psychological, natural history, life-history, and ecological references clearly relate to behavior, whereas some of the physiological references are more obviously concerned with biochemistry than behavior. Reprints published by the Society for the Study of Amphibians and Reptiles will probably continue to make material from the past century available and a new nonprofit search service should keep turtle researchers aware of future publications. A leucistic specimen of the Short-headed Gartersnake, Thamnophis brachystoma. An adult male (254 mm snout to vent) collected along Chappel Fork, between Kinzua Dam and Marshburg, McKean Co., Pennsylvania, on 21 August 1971. The specimen is white with pale beige dorsal stripes. The iris appears to be normally pigmented. -- G. C. Schaefer (Dept. Biological Sci., Kent State University, Kent, Ohio 44242).

AN UNUSUAL SPECIMEN OF Thamnophis marcianus FROM VERACRUZ, MEXICO

Douglas A. Rossman

While my recent paper (Rossman, 1971) on the Neotropical populations of Thamnophis marcianus (Baird and Girard) was in the hands of the printer, Ronald A. Brandon sent me an unusual specimen of this species from the Mexican state of Veracruz. Circumstances prevented its being discussed in that paper, but the animal is taxonomically and zoogeographically puzzling and deserves comment.

The snake (Southern Illinois Univ. uncatalogued) was collected along the banks of the Rio Jamapa, 9 miles S Huatusco, Veracruz, on 4 July 1965 by Ronald A. Brandon and Ronald Altig. It is an adult male measuring 388 mm snout-vent (the tip of the tail is missing) and having 19-19-17 dorsal scale rows, semi-divided preoculars, 152 ventrals, 30 teeth on the left maxilla, a very dark brown dorsum with most scales heavily impregnated with black pigment (less densely so in the one or two rows immediately above the lateral stripe), a tan vertebral stripe three scales wide, an uninterrupted light greyish tan lateral stripe occupying the second and third dorsal scale rows, two rows of small semicircular black spots on the venter, and a typical marcianus head pattern (Fig. 1).

The Veracruz snake agrees with Thamnophis marcianus praeocularis in maximum dorsal scale row number, condition of the preoculars, number of maxillary teeth, nature of the vertebral stripe, and ventral pattern. It is similar to lowland Mexican T. m. marcianus in ventral number and in having the lateral stripe uninterrupted by extensions of the anterior lateral blotches. The darkness of the dorsum is unique to this specimen, which probably is best considered an intergrade although it is considerably closer to T. m. praeocularis than to the nominate race. This presents a puzzling situation inasmuch as four specimens from the Chiapas-Tabasco lowlands, which I also consider to be intergrades and which come from an area nearly 350 miles closer to the range of T. m. praeocularis, have many more features in common with T. m. marcianus. Specimens from southern Veracruz and western Tabasco are much to be desired.

The Rio Jamapa collecting site is atypical for Thamnophis marcianus. The stream rushes through a heavily vegetated, rocky gorge in a rain forest-cloud forest transition zone at an elevation of 4500', the only non-lowland locality for this species in eastern Mexico or Central America.

GEOGRAPHIC DISTRIBUTION

HERPETOLOGICAL REVIEW will publish brief notices of new geographic records in order to make these available to workers in published form. The STANDARD FORMAT for these records is:

SCIENTIFIC NAME. Locality [air-line distance and direction from a town]; Date; Collector. Identified or verified by. Place of deposition and catalogue number. Comments. SUBMITTED BY, and address.

Please submit new locality records to: GEORGE R. ZUG, Division of Reptiles & Amphibians, National Museum of Natural History, Washington, DC 20560.

Contributions to this page may be cited as follows:

TUCK, R. G., Jr. 1972. Geographic distribution: Hemidactylus palaichthus. HERPETOL REV 4(3): 93.

FURMONT REPTILE HOOKS
1815 BAHAMA DR. SEABROOK, TX. 77586

FURMONT REPTILE HOOKS are the results of more than two years of field and zoo testing. They are the finest available and are presently used by more than eight nationally recognized zoos. Other sizes and designs are available - write for a complete catalog.

NOTE: Item #4, "The Stump Ripper" is an extra heavy duty field hook. The special C-Offset Tip lies flat on the ground when held by a right handed person so the hook can be used for reptile capture as well as for stump ripping, board fliping, and rock pulling in the same manner as a potato rake but it weighs 1/4 as much. A left handed version is available.

Copyright © FurMont Reptile Hooks 1972

HOW TO ORDER

1. Specify model number.
2. List options if desired.
3. Add or deduct amount indicated for each option from base price.
4. Make your check or money order payable to FURMONT REPTILE HOOKS. Prices are postpaid in the U.S.A. Texas residents add 5% Sales Tax.
5. Mail your order to FURMONT REPTILE HOOKS 1815 Bahama Drive - Seabrook, Texas 77586.

A NEW RECORD OF THE DESERT STRIPED WHIPSNAKE (Masticophis taeniatus taeniatus) FROM THE PROVIDENCE MOUNTAINS REGION OF SAN BERNARDINO COUNTY, CALIFORNIA

Timothy W. Brown

On June 15, 1970 a desert striped whipsnake (Masticophis taeniatus taeniatus) was found DOR on Black Canyon Road approximately 0.8 km. south of Cedar Canyon and about 11.2 km. southeast of the town of Cima, California. This location lies at an elevation of 1545 meters in the Mid-Hills section of the Providence Mountains (see Mid-Hills, California quadrangle, USGS 15' series. T. 12N, R. 14E, S. 31). The snake is a female with a snout-vent length of 508 mm. and a tail length of 221 mm. No eggs were present, nor had the snake recently fed. The specimen has been placed in the Museum of Vertebrate Zoology, University of California, Berkeley (MVZ 100271).

The Mid-Hills region is a rolling plateau dotted with granite outcrops and rhyolitic buttes. It lies at an elevation of 1500-2000 meters between the Providence Mountains to the south and the New York Mountains to the northeast. This upland complex is entirely surrounded by Lower Sonoran Desert bajadas and basins which dip as low as 600 meters in elevation to the southeast. The Mid-Hills vegetation is strongly suggestive of the Great Basin Desert some 280 km. to the north (Jaeger, 1957). Pinyons (Pinus spp.) and Utah juniper (Juniperus osteosperma) form an open woodland in most places, while the shrubs are dominated by big sagebrush (Artemisia tridentata), antelope bush (Purshia glandulosa), and rabbitbrush (Chrysothamnus spp.). This plant association contrasts sharply with the vegetation at lower elevations. There the bajadas support a yucca-Joshua tree (Yucca brevifolia) community, while the low basins are dominated by a sparse creosote bush (Larrea divaricata) scrub. Thus the Providence Mountains - Mid-Hills - New York Mountains complex appears to support a relict Great Basin Desert community at higher elevations isolated by climatically unsuitable lowlands on all sides.

Apparently Masticophis taeniatus is uncommon but not rare in the Mid-Hills. Local ranchers and the rangers at Mitchell's Caverns State Park report seeing several each year. Johnson et al (1948) do not mention this snake in their report of this area. However, they do report having taken three specimens from the higher elevations of Clark Mountain, a similarly isolated upland 48 km. to the north. Stebbins (1954 and 1966) also records the Clark Mountain population but none from the Providence Mountains area.

Therefore, the Providence Mountains - Mid-Hills population of Masticophis taeniatus taeniatus appears to be the southernmost in California and a true postglacial relict of the Great Basin Desert. The Great Basin fence lizard (Sceloporus occidentalis biseriatus) is also found in this area. It is likely that further studies will turn up still other relict species in this isolated upland complex.

I wish to thank Dr. Robert C. Stebbins of the University of California, Berkeley, for his helpful advice on the known distribution of Masticophis taeniatus.

A PLEA FOR CONSERVATION

Harold A. Dundee

The following plea was made at the June 1972 meeting of the American Society of Ichthyologists and Herpetologists. Dr. Dundee asked that it appear in HERPETOLOGICAL REVIEW so that the remarks receive a wider audience.

In recent years the American Society of Ichthyologists and Herpetologists has expressed its concern about the future of our faunal heritage. Indeed, it has gone far to express its concern by vigorously supporting the endangered species act; by pushing for federal legislation to place the alligator under interstate commerce protection; by recommending guidelines for responsible conduct of research activities, especially as regards procuring animals for research; and as of the 1972 meeting we debated our feelings concerning introductions of exotic species without adequate pre-introduction studies. Yet we still disregard the danger signals that have been raised. Despite resolutions made at the 1971 meeting and their publication in the December 1971 issue of Copeia, flagrant disregard for guidelines is evident.

I would like to emphasize at this time aspects of three of the resolutions as food for thought. Please, --- please expose to your collective consciences the following:

1. Deliberate introductions. Recent new locality records for reptiles in Florida, Texas, and Louisiana, for example, are directly traceable to the dubious pleasures of having intriguing and interesting exotics enlivening the local collecting scene. Some such introductions have been made by members of our several professional herpetological societies. Introductions not only may flaw our concepts of natural zoogeographic distributions but especially they may disrupt normal ecosystems to the extent that the native fauna & flora may be severely damaged.

2. Scientific collecting. The encouragement of student collecting to augment zoogeographic knowledge of local or state faunas, which has undoubtedly brought to light greatly valuable and more complete knowledge, is fraught with pitfalls to the scholar who utilizes the information. Not only may such collecting decimate local faunas but more important the award of grade credits for such collections, especially when bonuses are offered for specimens from other than say the home country, may result in considerable deliberate falsification of collection data by the ever grade-conscious student.

3. Commercial exploitation. We have seen an unprecedented rise in amateur collector enthusiasm and the building of institutional collections, and concommitantly a great rise in the number of dealers trafficking in sales of lower vertebrates. All too often the dealers, encouraged by the high price that can be commanded for rare species or creatures of limited distribution, have made heavy inroads on those animals. Recent price lists have offered items such as Bufo exsul, Plethodon longicrus, Lampropeltis mexicana blairi, and Crotalus w. willardi at prices up to $250. Such crass commercialization can lead to rapid demise and extinction of many species long before we are prepared to examine significant aspects of their biologies.

It would be to the best long range objectives of scientists if they would boycott such dealers or foster action for suitable local or federal legislation to restrict their activities.

I know that many of us, including myself, could find ourselves living in the proverbial glass house. From conversations with various herpetologists I am aware that there may be strenuous objections to "policing" of our scientific endeavors but we must face the fact that we can indeed easily be our own worst enemies. An extinct species is not a renewable resource. Thus my plea that this is a time for us to expose our consciences to the realities of life and to reexamine the resolutions of the 1971 meetings and begin to conform to their recommendations.

CURRENT HERPETOLOGICAL TITLES, XXII: 1971 - 1972

Herpetological Information Search Systems
American Museum of Natural History
New York, New York 10024

We have brought to your attention more than 20,000 current titles in the pages of this journal to date.

The titles of papers appearing in our lists were obtained by regular scanning of about 2500 journals directly and more than 1000 through secondary sources such as Chemical Abstracts Biochemical sections, Current Contents, publishers' catalogs, etc. Theses in English also appear, coming from such sources as Dissertation Abstracts and various academic publications. Abstracts of papers presented at various meetings and symposia are included. A complete list of the journals covered by us is published in Herpetol. Yearb. 1971. The coverage of books and theses in languages other than English is improving because a larger number of our colleagues bring those titles to our attention. Some copies have been mailed directly to us for inclusion in our lists. However, we would still appreciate being made aware of new books, reports, and non-English theses.

We realize that many of the titles listed are marginal to the field of herpetology as customarily defined. Many are published in journals of physiology, pharmacology, cytology, or embryology. Others are from medical journals, state fish and game publications, or pet animal journals. Thus, they are not aimed at an audience of herpetologists. All of them, however, deal in some way with amphibians and reptiles. As such, they may be of interest to at least some readers of HERPETOLOGICAL REVIEW. It seems better to let the reader make the selection from the list, rather than one of our small group deciding that this paper or that -- or this kind of paper -- is of no interest to anyone.

Our present policy, then, is to list the title of any current paper (e.g., 1971-1972) that is concerned with a member of a Recent order of amphibians or reptiles.

HERPETOLOGICAL REVIEW has appeared bimonthly, beginning in 1971. This means that the titles published here will be more current than the previous quarterly issues allowed.

Except for the omission of extinct orders, our list is comparable with that of the Amphibia and Reptilia sections of the Zoological Record, though ours is more comprehensive and considerably more current.

This list contains titles of books and articles that have come to our attention during the period 1 June 1972 through 31 July 1972. HR is computer printed and because of necessary production procedures there is a possibility that on occasion the titles from a single issue of a journal may appear in several issues of HR. Periodical title abbreviations follow the International List of Periodical Title Word Abbreviations (based on the Amer. Nat. Standards Comm. Z39.) (Chemical Abstracts Service, Columbus, Ohio, US.).

Acknowledgements. This list was prepared by the HISS staff: H. G. Dowling, I. Gilboa, I. Palser, and M. Coxe. J. A. Peters of the U. S. National Museum has continued to provide a welcome back-up program to our search of the literature, and G. J. Jacobs of NASA has kept us informed of the many publications and translations resulting from the United States space efforts. The library staff of the Museum have continued to aid our project. Special thanks to the members of the Herpetology Department, AMNH for their aid in cross indexing, which allows us to offer new services. We continue to rely on the advice and aid of James E. Bradley of the University of Rhode Island Computer Laboratory. We also wish to thank the many individuals who have sent us early copies of reprints for inclusion here.

This is contribution Number 44 of the Genera of Reptiles Project, which is supported by the Information Services Program of the National Science Foundation (NSF GN-707).

Herpetological
Information
Search
Systems

With the addition of newsletters and current titles to its present stable of publications, HISS will provide a variety of services to the individual herpetologist in 1973. However, the cost of these services in subsequent years will be directly related to the number of INSTITUTIONAL subscriptions that we are able to obtain in the interim.

We urge each of you to ask your institution, library, or department (or all of these) to subscribe to one or more of the listed HISS publications. It is not necessary to use this form -- use any form -- but please make the request!

October 1972

TO:_____

Please place STANDING ORDERS, to begin in January 1973, for the indicated HISS publications. These are needed for the support of research activities and academic studies in this department.

SOCIETY FOR THE STUDY OF AMPHIBIANS AND REPTILES

Membership is open to anyone who is interested in amphibians and reptiles.

Members have voting privileges in the Society. They receive the JOURNAL OF HERPETOLOGY (2-3 issues/year), HERPETOLOGICAL REVIEW (6 issues/year), and FACSIMILE REPRINTS IN HERPETOLOGY (2-3 issues/year). They may purchase other Society publications at reduced rates.

Regular Member:
U.S. & Canada.....$8.00
Other Countries.....$6.00

Sustaining Member.....$10.00

Contributing Member.....$15.00

INSTITUTIONAL SUBSCRIPTION to "SSAR Package" (J HERPETOL, HERPETOL REV, FASC REPR)...$16.00

Write: HENRI C. SEIBERT
Treasurer, SSAR

CATALOGUE OF AMERICAN AMPHIBIANS AND REPTILES
(Now published by the SSAR)

A loose-leaf series of 2- to 4-page species accounts of the amphibians and reptiles of the Americas, with special emphasis on those in the United States and Canada. Accounts 1-125 were published from 1963 to 1971.

Binder, Taxonomic Tabs, and Accounts 1-125.

Individuals..... $22.00
INSTITUTIONS..... $27.00

Subscription for 1972

(Accounts 126-150)

Individuals..... $ 5.00
INSTITUTIONS..... $ 7.00

HERPETOLOGISTS' LEAGUE

All persons interested in herpetology are eligible for membership.

Members receive HERPETOLOGICA (4 issues/year) and HERPETOLOGICAL REVIEW (6 issues/year). They may submit manuscripts for publication in both these journals, and may present papers at the League's Annual Meeting.

HERPETOLOGICA has been published regularly since 1936. All back issues are available.

Member..... $8.00

Fellow (elected).....$10.00

INSTITUTIONAL SUBSCRIPTION to HERPETOLOGICA.....$15.00

Write: HOBART E. LANDRETH
Secretary-Treasurer, H L
R. R. #1, Box 478
Oklahoma City, OK 73111

ADVICE TO AUTHORS

HERPETOLOGICAL REVIEW publishes feature articles that pertain to amphibians and reptiles, the people who study them, and the relevant societies and institutions. It is not intended as an outlet for reporting the results of research on these animals. Articles describing (and/or photographs illustrating) rarities, expeditions, laboratories, societies, museums, and historical articles that pertain to herpetological study are especially welcome.

FORMAT. Manuscripts should be type-written on white bond paper, one side only. All material, including legends for figures and literature cited, is to be double-spaced. Scientific names of genera and species are underlined. Titles should indicate clearly the subject and the animal group(s) included. Use standard abbreviations for journals.

The 1971 YEARBOOK OF HERPETOLOGY (published by HISS) contains a list of American Standard abbreviations for some 2,500 journals. Other publications that will be of assistance in the preparation of manuscripts are:

CATALOGUE OF AMERICAN AMPHIBIANS AND REPTILES (see information on this page).

Common names for North American amphibians and reptiles (COPEIA 1956(3): 172-185).

SCIENTIFIC WRITING FOR GRADUATE STUDENTS, by F. Peter Woodford (Rockefeller Univ. Press, New York, NY 10021). $5.75.

STYLE MANUAL FOR BIOLOGICAL JOURNALS (American Institute of Biological Sciences, 3900 Wisconsin Avenue, NW, Washington, DC 20016). $3.00.

A publication that will be found helpful in planning and producing adequate illustrations is:

A HANDBOOK OF BIOLOGICAL ILLUSTRATION, by Frances W. Zweifel (University of Chicago Press, 58th Street at Ellis Avenue, Chicago, IL 60637).

Line-cuts are photo-offset directly with the text, and should have widths of 4 1/4 inches (one column) or 9 1/4 inches (two columns). Each line of illustration equals six lines of text (full page copy length is 12 3/4 inches). Line cuts are reduced about 25 per cent in processing.

Photographs and drawings reproduced by half-tone plates are handled separately but should be planned for one-column or two-column reproduction.

PAGE CHARGES AND REPRINTS

Authors of articles or reports submitted to H R are asked to contribute toward their publication costs to the extent of $20 per page. This payment is not a prerequisite to publication. However, paid articles receive priority and are likely to appear earlier than others.

Page-charge payments entitle the author to 100 reprints (or tear-sheets) without additional charge. [Additional reprints may be purchased at $5/page/per 100 copies.]

Cost-sharing of this kind allows additional publication without increasing H R's cost to Society members and subscribers. It is, thus, a method of holding dues and subscription rates at their present levels.

CHANGE OF ADDRESS

HISS now handles the mailing lists for:

THE SOCIETY FOR THE STUDY OF

AMPHIBIANS AND REPTILES

THE HERPETOLOGISTS' LEAGUE

and the

CATALOGUE OF AMERICAN AMPHIBIANS

VOLUME 4, NUMBER 4
AUGUST 1972

SOCIETY FOR THE STUDY OF AMPHIBIANS AND REPTILES

The Society was founded in 1958 as the OHIO HERPETOLOGICAL SOCIETY. Following rapid growth of membership and expansion of operations, the organization became the SOCIETY FOR THE STUDY OF AMPHIBIANS AND REPTILES in 1967.

The SSAR encourages the acquisition of knowledge on amphibians and reptiles, and the dissemination of scientific information of these animals. It encourages the conservation of wildlife in general, and of amphibians and reptiles in particular. A major effort is made to achieve closer cooperation and effective communication between amateur and professional workers. (See Third Cover for membership information.)

HERPETOLOGISTS

LEAGUE

The Herpetologists' League is an international organization which was established in 1936 by Major Chapman Grant. It is dedicated to furthering knowledge of the biology of amphibians and reptiles.

In 1971 it had 900 members and fellows (including Life and Honorary members), and more than 400 institutional subscriptions to its journal, HERPETOLOGICA, which has been published continuously since 1936.

All persons interested in herpetology are eligible for membership. (See Third Cover for membership information.)

Dr. Herndon G. Dowling
Genera of Reptiles
American Museum of Natural History
Central Park West at 79th Street
New York, New York 10024

Dear Herndon,

In response to your editorial in the most recent Herp Review, please record me as **willing** to support HISS to the amount of $25.00 a year. I hope you get sufficient response from other herpetologists willing to help keep the operation going so that we can continue to have the services you have successfully started.

Cordially,

James A. Peters

Dr Herndon G. Dowling
Editor
HERPETOLOGICAL REVIEW
Herpetological Information Search Systems
The American Museum of Natural History
Central Park West at 79th Street
New York, NY 10024

Dear Dr Dowling:

During the organizational meeting of the Eastern Seaboard Herpetological League [ESHL] on 23 April 1972, one of our first official acts was to go on record collectively in support of the HISS project "Current Herpetological Titles" [HERPS-ACCORD 3, p. 1].

This resolution was in direct response to your editorial, which appeared in HERPETOLOGICAL REVIEW, 4(2): 28, April 1972, and it represented a genuine belief in the real need for such a bibliographic effort among those of us in regional herpetological groups.

At this time I wish to express my <u>personal</u> confidence in the substantial contribution made to herpetology by "Current Titles" and my deep desire to see this project continued without interruption. Accordingly, I hereby pledge an additional payment of ten dollars ($10.00) annually in order to continue receiving "Current Herpetological Titles."

Furthermore, I call upon <u>all</u> herpetologists -- professional, paraprofessional, and amateur -- to stand up and make their pledges NOW!

Sincerely,

Robert G. Tuck, Jr.
Coördinator, ESHL

RIJKSMUSEUM VAN NATUURLIJKE HISTORIE, LEIDEN.

Dr. H.G. Dowling,
Department of Herpetology : HISS
American Museum of Natural History,
Central Park West at 79th Street,
New York, N.Y. 10024,
U.S.A.

Leiden, June 14 1972

Dear Dr. Dowling,

In the April 1972 issue of Herpetological Review I read your editorial in which you ask members to write whether they appreciate the Current Herpetological Titles and if so, whether they are willing to pay more for it next year. As the "Titles" are of much help to me, I am glad to tell you that The Rijksmuseum van Natuurlijke Historie is prepared to pay ƒ 10.- a year more when this would turn out to be necessary.

Sincerely yours,

M.S. Hoogmoed,
Curator, Division of
Reptiles and Amphibians.

MEETINGS AND SOCIETIES

CALENDAR 1972

14-17 August...Combined Meeting: HERPETOLOGISTS' LEAGUE and SOCIETY FOR THE STUDY OF AMPHIBIANS and REPTILES, University of Oklahoma Biological Station, Lake Texoma.

27 August - 1 September...AMERICAN SOCIETY OF ZOOLOGISTS, University of Minnesota (with AIBS).

11-15 September....INTERNATIONAL SOCIETY ON TOXINOLOGY, General Meeting, Institute of Organic Chemistry, Darmstadt, West Germany.

24-30 September...INTERNATIONAL CONGRESS OF ZOOLOGY, Monaco.

26-28 December....HERPETOLOGISTS' LEAGUE, Annual Meeting (Cosponsored by the SSAR), Washington, D.C. (with AAAS).

CALENDAR 1973

June....AMERICAN SOCIETY OF ICHTHYOLOGISTS AND HERPETOLOGISTS, Annual Meeting, San Jose, Costa Rica.

4-11 August....FIRST INTERNATIONAL CONGRESS OF SYSTEMATIC AND EVOLUTIONARY BIOLOGY, Boulder, Colorado.

CALENDAR 1974

June....AMERICAN SOCIETY OF ICHTHYOLOGISTS AND HERPETOLOGISTS, Annual Meeting, Ottawa, Canada.

INDIVIDUALS AND INSTITUTIONS

ROBERT E. GORDON (VP for Advanced Stud., Univ. Notre Dame) received the Council of Biology Editors' "Award for Excellence in Scientific Communication" at a banquet during the Sixteenth Conference of CBE on 15 May.

GEORGE CALLISON (Los Angeles County Mus. Natur. Hist.) is seeking the evolutionary relationships of New World boids in both living and fossil material.

R. BRUCE BURY (Mus. Vert. Zool., Univ. Calif.) has been appointed to a position at the U. S. National Museum. Because of his broad interests in conservation, he has also been appointed Conservation Editor for HR.

RICHARD G. ZWEIFEL and CHARLES J. COLE (Amer. Mus. Natur. Hist.) will be at the AMNH Southwestern Field Station, near Portal, Arizona, for a summer's research.

JOHN W. CRENSHAW (Univ. Rhode Island) has moved to the School of Biology, Georgia Institute of Technology, Atlanta.

The 19th SYMPOSIUM ON VERTEBRATE PALEONTOLOGY AND COMPARATIVE ANATOMY was held in Bristol, England, on 28 September through 1 October 1971. Among the contributions were a new classification of the Boidae, with a discussion of their radiation by GARTH UNDERWOOD. Work on the intervertebral joints of snakes and lizards was described by LESLEY SHEPPARD and ANGUS BELLAIRS. ELAZAR KOCHVA showed a film on vipers feeding after removal of their venom glands.

Volume 4 of the SNAKE, a journal published by the Japan Snake Institute, will appear in 1972. Because of devaluation of the US dollar, each issue will now cost $2.00 (volume 4 will consist of 3 issues). Back issues of the three previous volumes are still available at the new cost. Most articles are in Japanese, but have English summaries.

Subscriptions and inquiries should be addressed to:

The Japan Snake Institute
Yabuzuka 3318
Yabuzuka-honmachi
Nitta-gun, Gunma-ken
379-23 JAPAN

MEMBERS DESIDERATA

MORRIS K. JACKSON (Dept. Anatomy, Medical Coll. Georgia, Augusta, GA 30902) is working on the structure of cutaneous tactile sensory organs in snakes. He would appreciate any snake exuviae (sloughs) that zoos, museums, herpetariums, or individuals could send. It can be sent in a regular envelope. Please include name of species, and if available subspecies and collection data.

THE LAKE TEXOMA MEETING

PROGRAM AND ABSTRACTS

SUNDAY, 13 AUGUST 1972

1:00 PM Board of Directors Meeting, Library

4:00 PM Early Check-in and Registration, Lounge, Main Building

---

MONDAY, 14 AUGUST 1972

8:00 AM REGISTRATION and Check-in, Lounge, Main Building, all day

8:00 PM Committee on Joint Cooperation Meeting
Lecture Room, Main Building

TUESDAY, 15 AUGUST 1972

All paper sessions will be held in the Library.

8:30 AM CALL TO ORDER: Clarence J. McCoy (Carnegie Museum), Chairman, Society for the Study of Amphibians and Reptiles.

WELCOME: Paul F. Sharp, President University of Oklahoma and Loren G. Hill, Director, University of Oklahoma Biological Station.

ANNOUNCEMENTS: Victor H. Hutchison, University of Oklahoma

CONTRIBUTED PAPERS

Robert G. Webb, (University of Texas - El Paso), Presiding.

9:00 AM Aggressive behavior in the Pacific pond turtle, Clemmys marmorata. R. Bruce Bury (Bureau of Sports Fisheries and Wildlife, Washington).

9:20 AM Aggressive display in some Guatemalan and Mexican anoles. Anthony A. Echelle, Alice F. Echelle (University of Oklahoma Biological Station), Henry S. Fitch (University of Kansas).

9:40 AM Shoreline imprinting in the tiger salamander (Ambystoma tigrinum). Douglas H. Taylor (Miami University), Kraig Adler (University of Notre Dame).

10:00 AM Salamander intraspecific and interspecific territoriality and social dominance, and their significance for interspecies competition. Gordon R. Thurow (Western Illinois University).

10:30 AM Coffee Break

11:15 AM Means for the mechanical immobilization of live snakes. William W. Youker and Henry L. Youker (Wheaton, Illinois).

11:35 AM A cytogenetic study of the turtles in the genera Clemmys, Mauremys, and Sacalia. John W. Bickham (University of Dayton).

11:55 AM Relationships of the water snakes (genus Natrix): A progress report. Douglas A. Rossman, W. Gary Eberle, Shou-hsian Mao, Herbert C. Dessauer, and Edmond V. Malnate.

Albert P. Blair (Tulsa University), Presiding.

2:00 PM Fatty acid composition of the dermal secretions of Plethodon cinereus. Thomas Rickrode, Charles F. Mueller and David Taylor (Slippery Rock State College).

2:20 PM Geographic Variation in Muscle Proteins from Cynops sp. in Japan and Ryukyu Islands. J. Kirwin Werner (Northern Michigan University).

2:40 PM The effects of mammalian glucagon on plasma glucose in the Mudpuppy (Necturus maculosus). Elliott Jacobson (University of Missouri).

3:00 PM An electrophonetic comparison of proteins in turtle species of the genera Clemmys, Mauremys, and Sacalia. Donald A. Merkle (University of Dayton).

3:20 PM Coffee Break

3:50 PM Temperature effects on energetics of the Rusty Lizard Sceloporus olivaceous. Ronald Dutton and Lloyd Fitzpatrick (North Texas State University).

4:10 PM The Pleistocene herpetofauna of Dark Canyon Cave, New Mexico. Edward O. Wiley III (Sam Houston State University).

4:30 PM Comparative cranial myology of North American natricine snakes. Alexander Varkey (Louisiana State University).

8:00 PM SMOKER - SOCIAL, Pavilion area, South Lawn, for all registrants.

WEDNESDAY, 16 AUGUST 1972

M. J. Fouquette (Arizona State University), Presiding.

8:30 AM Regulation of spiny lizard populations: a progress report. G. W. Ferguson and C. H. Bohlen (Kansas State University).

8:50 AM Population variability of Acanthocephala from Slider turtles. Joseph E. Bourque (Savannah River Ecology Laboratory, Aiken, South Carolina).

9:10 AM Sexual dimorphism in the mainland anoles. Henry S. Fitch (University of Kansas), Anthony A. Echelle and Alice F. Echelle (University of Oklahoma Biological Station).

9:30 AM Food item analysis of mixed tadpole populations from Thailand. W. Ronald Heyer (Pacific Lutheran University).

9:50 AM Reproductive strategy of the Tree Lizard, Urosaurus ornatus, in central Texas. Robert F. Martin (University of Texas - Austin).

10:10 AM Coffee Break

10:50 AM Occurrence of larval amphibians in a heated reservoir. David H. Nelson (Savannah River Ecology Laboratory, Aiken, South Carolina).

11:10 AM Species composition and man-induced changes in a complex of snake hibernacula in northern Utah. William S. Parker (University of Utah).

11:30 AM Density, growth rates and home range sizes of Phrynosoma cornutum in southern Dona Ana County, New Mexico. Richard D. Worthington (University of Texas - El Paso).

11:50 AM Ecological observations of Bufo marinus in Papua-New Guinea. George Zug, Eric Lindgren and John Pippet. (Smithsonian Institute, Washington, D.C.).

12:10 PM GROUP PHOTOGRAPH, South side of Main Building.

James R. Dixon (Texas A and M University), Presiding.

2:00 PM Herpetology, Conservation and Departments of Conservation. Max A. Nickerson and Adrian Czajka (Milwaukee Public Museum).

2:20 PM Herpetologists, their societies and publications. I. Gilboa and H. G. Dowling (Herpetological Information Search Systems, American Museum of Natural History).

2:40 PM Systematic Herpetology: Prognosis for the Future. William E. Duellman (University of Kansas).

3:00 PM Coffee Break

3:30 PM PANEL DISCUSSION on the Future of Herpetology - Where Goest Our Two Societies? Joint Committee on Cooperation (Kraig Adler, H. G. Dowling, R. E. Gordon, H. F. Landreth, C. J. McCoy, H. C. Seibert, W. W. Tanner, V. H. Hutchison, Chairman). The presentation by panel members will be followed by audience participation and discussion of possible future cooperative efforts to improve services for herpetology.

7:30 PM BANQUET, South Lawn.

THURSDAY, 17 AUGUST 1972

8:00 AM FIELD TRIP. Information and registration sheets for box lunches will be provided at the Registration Desk.

1:00 PM CHECK OUT of rooms and dormitories to be completed, except for persons needing individual arrangements to remain overnight.

Bickham, John W. (University of Dayton). A cytogenetic study of the turtles in the genera Clemmys, Mauremys, and Sacalia.

The current taxonomic status of the Clemmys complex of turtles places the genera Mauremys, and Sacalia in the subfamily Batagurinae, and the genus Clemmys in the subfamily Emydinae. These three genera were previously considered to be congeneric. Cytogenetic techniques were used to evaluate this partitioning. Air dried preparations of cultured leukocytes yielded high quality metaphase plates of representatives of all three genera. The diploid number has been found to vary in species within and between genera. Fluorescent techniques and differential staining methods were also used to aid in the identification of individual chromosome pairs.

BOURQUE, JOSEPH E. (Savannah River Ecology Laboratory and Wake-Forest Univ.). Population Variability of Acanthocephala From Slider Turtles.

Acanthocephalan populations in more than 60 Pseudemys scripta were collected from a variety of habitats on the Savannah River Plant in South Carolina. Comparison of parasite populations was in terms of: (1) number of species (2) dominant species (3) number of worms per host (4) size structure and (5) sex ratio. Four species of Neoechinorhynchus sometimes occurred simultaneously in a single turtle. In most habitats N. pseudemydis made up the largest percent of the parasite numbers. Size structure analysis of over 10,000 worms from 60 hosts showed high degree of variability in turtles from each collecting area. The coefficient of variation for the number of young worms was twice as high as for the total number of worms in the population, or the number lost. The largest worms (♂ 35mm; ♀ 60mm) were from hosts with relatively few parasites. Sex ratios and size class of worms were related.

BRODIE, EDMUND D., Jr., JOHN HENSEL, and JUDY JOHNSON (Clemson Univ., S.C.).

Toxicity and Defensive Behavior in the Salamander genus Taricha.

NO ABSTRACT RECEIVED

BURY, R. BRUCE (Bureau of Sport Fisheries and Wildlife). Aggressive behavior in the Pacific pond turtle, Clemmys marmorata.

There is little evidence of aggressive behavior in freshwater turtles and, in fact, an absence of agonistic behavior has been reported in Pseudemys scripta and Chrysemys picta. However, field studies on the Pacific pond turtle revealed several types of social interactions, including aggression. Antagonism among turtles during periods of aquatic activity was rare, but one fight was observed. There was a relatively high level of interaction when turtles were engaged in atmospheric basking. During 37 hours of observations a total of 146 interactions were recorded: 111 (76.5%) open mouth gestures, 11 (7.5%) attacks involving biting, and 24 (16.0%) instances of ramming. The open mouth gesture is regarded as a threat in that it preceded all hostile behavior and was responded to accordingly by conspecifics. Several factors influencing aggressive behavior are discussed. In this species aggression apparently serves to promote spacing during times of atmospheric basking and, perhaps, to obtain and maintain "preferred" sunning sites.

DUELLMAN, WILLIAM E. (Univ. Kansas). Systematic herpetology: Prognosis for the future.

Today we are witnessing a change in the utilization of systematic collections from conventional taxonomic and faunistic studies to interdisciplinary studies using collections as data bases for evolutionary and ecological models. We anticipate that this trend will continue but not to the exclusion of the more conventional uses, which are necessary for basic research on some taxonomic groups and in some poorly known geographic regions. As a result of this trend, systematic collections will be called upon to provide a greater variety of data to more diverse kinds of investigators associated with educational and/or research institutions, commercial firms, and state and federal agencies. Thus, not only will the utilization of systematic collections change, but the role of curators will change from that of caretaker-researchers to research-coordinators; more and more of the caretaker responsibilities will be handled by trained technicians. Curators will assume more responsibilities in coordinating the utilization of data bases (collections) with diverse kinds of research programs--environmental, epidemiological, etc. Renewed emphasis must be placed in acquiring well-documented collections from poorly known areas that are in danger of destruction. Interdisciplinary investigations will be most effective when systematic collections are fully automated.

DUTTON, RONALD H. AND LLOYD C. FITZPATRICK (North Texas St) Temperature Effects on Energetics of the Rusty Lizard, Sceloporus olivaceus.

The energy budgets of lizards, Sceloporus olivaceus, collected seasonally from Tarrant County, Texas were measured in the laboratory at 15, 20, 25, and 30 C. These temperatures approximate ambient field temperatures at time of collections. Prior to measurements, lizards were held at experimental temperatures for 4 days without food in environmental chambers. After this period, their rates and energies of ingestion, egestion, assimilation, respiration and production were determined.

The results of this study are reported in this paper.

Echelle, Anthony A., Alice F. Echelle and Henry S. Fitch (Univ. Okla. Biological Station and University of Kansas). Aggressive display in some Guatemalan and Mexican anoles.

A preliminary analysis is presented of aggressive display in some Guatemalan and Mexican anoles. Emphasis is given to some subspecific comparisons of dewlap characteristics and display-action-patterns.

Ferguson, G. W. and C.H. Bohlen (Kansas State Univ.). Regulation of spiny lizard populations: a progress report.

Data on density, movement, growth, survivorship, fecundity and social behavior are being collected from a small insular population of the prairie swift Sceloporus undulatus garmani. Several more generations will be monitored to provide baseline data on natural populations fluctuations and to answer the questions: 1) When in the life cycle are density dependent effects most severe, 2) are these effects mediated through social behavior? Simultaneously, more controlled studies are underway using experimental enclosures to answer these questions. Future goals include perturbations of potential limiting factors in natural populations and enclosed natural populations in order to construct quantitative models of population regulation, and comparative studies of regulation in short-lived and long-lived species or races of the species.

Fitch, Henry S. (U. Kansas), Echelle, Anthony A. & Echelle, Alice F. (U. Oklahoma) Sexual dimorphism in the mainland anoles.

In anoles as in most iguanids, sexual dimorphism is usual and involves larger size and better developed display organ (dewlap) in the male, related to combat, defense of territory and courtship. Sexual difference in size and habits may relieve intraspecific competition; Schoener and Williams have shown that such difference is characteristic of the allopatric insular species. On the mainland most species are sympatric with others in at least parts of their ranges, and as many as 7 species may occur together. In a few species such as Anolis limifrons and its near relatives, females average slightly larger than males. In some other species the sexes are approximately the same size, but in most males are larger — up to 1.32 times the linear dimensions of females in A. cuprinus. In most species the female lacks a colored dewlap; in some she has a dewlap that is relatively small, and in a few kinds she has a well developed dewlap comparable to the male's. Trends of sexual dimorphism in development of the dewlap do not parallel closely dimorphism in size. Trends of sexual dimorphism in ten species-groups are discussed.

GILBOA, I., and H. G. DOWLING (Amer. Mus. Natur. Hist., N.Y.). Herpetologists: their societies and publications.

The continuing specialization and compartmentalization within the field of herpetology, and the application of new techniques of research to this field, has led to the use of increasingly diverse serials for the publication of the results of this research.

Many contributors to the knowledge on amphibians and reptiles consider themselves ecologists, physiologists, or cytologists, rather than herpetologists. They do not belong to any of the herpetological societies, they do not attend herpetological meetings, and thus take no part in decisions made for the "herpetological community." Yet these workers produce a major portion of the information on amphibians and reptiles, and publish most of this in "outside" journals.

In 1969 for example, the 60 papers (by 48 authors) published in HERPETOLOGICA, the 60 articles and abstracts published in the JOURNAL OF HERPETOLOGY, and the 75 papers (by 68 authors) published in COPEIA altogether amounted to only 4.5 per cent of the "herpetological literature" for that year. Few institutions receive even a significant portion of the some 2000 journals in which the other 95.5 per cent appeared.

HEYER, W.RONALD. (Pacific Lutheran Univ.). Food item analysis of mixed tadpole populations from Thailand.

Gut contents were examined for 17 species of tadpoles from a series of ponds along a 6 km transect in Northwestern Thailand. Three morphological types of tadpoles were examined: those which have beakless mouthparts (8 species, family Microhylidae); those with scraping and chewing mouthparts (7 species, families Ranidae and Rhacophoridae); and those with a tube ending with horny lips (2 species, family Ranidae, genus Ooeidozyga). Two species of beakless larvae had different categories of food types in their guts: arthropods. All other species had the same types of food in the gut. Most species did not differ significantly in the sizes of the items in the gut. The methods and results of this study raise several questions about the feeding process in tadpoles.

Jacobson, Elliott
The effect of Mammalian Glucagon on Plasma Glucose in the Mudpuppy(Necturus maculosus).

The effect of mammalian glucagon on plasma glucose levels was studied in the paedogenic urodele, Necturus maculosus. Animals were kept in a temperature controlled and light controlled box at 22°C and 13 hrs light and 11 hrs dark respectively. Serial blood samples were collected from a cannula implanted in the dorsal aorta via the gastric artery and plasma glucose levels were determined by the glucose oxidase method. Plasma glucose levels of untreated animals were 39$\pm$ 5 mg% at completion of the operation and then declined to 11$\pm$ 2 mg% on the third post-operative day; the values remained relatively stable thereafter. The third post-operative day was chosen as the day to challenge the animal with the hormone. The effect of glucagon on plasma glucose was determined. Experimental animals received either 2 mg/Kg body weight or 1 mg/Kg body weight of glucagon in amphibian Ringer's; control animals received an equivalent amount of the hormone-free carrier. Plasma glucose levels for the group receiving glucagon at 2 mg/Kg body weight were significantly higher than those of the controls from 30 minutes through 24 hrs after infusion of the hormone. Plasma glucose levels for the group receiving glucagon at 1 mg/Kg body weight were significantly higher than those of the controls only at 30 minutes after the infusion of the hormone. The data demonstrate that mammalian glucagon has a hyperglycemic effect in Necturus maculosus.

MARTIN, ROBERT F. (Texas Memorial Museum; University of Texas, Austin) Reproductive strategy of the tree lizard, *Urosaurus ornatus*, in central Texas.

In 1971, during a period of severe drought, the reproductive season of *Urosaurus ornatus* extended from March through mid-August. Females became sexually mature at approximately 39 mm snout-vent length. Deutoplasmic activity commenced in March; ovulation began in late April. Hatchlings first appeared in late June. Individual females possessed multiple clutch potential; sufficient time was available to permit at least 3 clutches per season. Clutch size was larger earlier in the season ($\bar{X}$ = 6.3, May) than later ($\bar{X}$ = 4.5, June; $\bar{X}$ = 3.7, July; $\bar{X}$ = 4.2, August) and averaged 5 eggs per clutch overall. Oviducal egg complements averaged 23% of total body weight.

MERKLE, DONALD A. (Univ. of Dayton). An electrophoretic comparison of proteins in turtle species of the genera Clemmys, Mauremys, and Sacalia.

The current taxonomic status of the Clemmys complex of turtles places the genera Mauremys, and Sacalia in the subfamily Batagurinae, and the genus Clemmys in the subfamily Emydinae. These three genera were previously considered to be congeneric. Starch gel electrophoretic techniques were used to examine relationships within and between genera. Thirteen protein loci were examined, including those coding for general proteins, esterases, LDH, MDH, LAP, and GOT. Of the loci examined, LDH-2 showed the greatest generic specificity in separating the three taxa, and presumably could be useful in taxonomic work with other turtle genera. Certain other loci (e.g., MDH-1, MDH-2), while of limited taxonomic value in distinguishing between genera, were of value in delimiting intra-generic relationships.

NELSON, DAVID H. (Savannah River Ecology Laboratory and Michigan State University). Occurrence of larval amphibians in a heated reservoir.

From June, 1971, to May, 1972, samples were systematically removed from a reservoir receiving heated effluent from a nuclear reactor in South Carolina. Specimens were caught with dipnets or minnow traps at study sites along 1200 meters of shoreline. Species diversity of thermally stressed areas is compared with that of cool water, natural seepage ponds flanking the reservoir. Larvae of the most common amphibians were found to inhabit the cooler shallows of the reservoir, although diversity was low in comparison to nearby natural areas. Developmental rates exhibited by Bufo terrestris tadpoles collected from different temperature regimes generally reflect the degree of thermal loading. Death from heat and fluctuating water levels appears to be the dominant limitation to larval success.

NICKERSON, MAX A. and CZAJKA, ADRIAN (Mil. Public Museum) Herpetology, Conservation & Departments of Conservation.

All 50 state departments of conservation were polled via questionnaire to determine: (1) how many (if any) of their staff members they considered herpetologists and their educational backgrounds (2) if the departments estimated populations of amphibians or reptiles and if so were these only species of economic importance or "endangered" species (3) if they planned to utilize their staff to study populations of amphibians and reptiles or hire new personnel with backgrounds in herpetology.

The answers were compiled and analyzed. The results will be presented and a discussion of potential conservation approaches, problems and implications is solicited.

PARKER, WILLIAM S., and WILLIAM S. BROWN (Univ. of Utah). Species composition and man-induced changes in a complex of snake hibernacula in northern Utah.

Five complexes of snake hibernacula along 4.5 km of the Stansbury Mtns. are used by four snake species: rattlesnake (Crotalus viridis lutosus), racer (Coluber constrictor mormon), whipsnake (Masticophis t. taeniatus), and gopher snake (Pituophis melanoleucus desorticola). Seven hibernacula of two complexes 650 m apart were studied intensively in 1971 and 1972. Whipsnakes and rattlesnakes seem restricted to specific dens in a complex and are completely absent from several hibernacula. In contrast, racers and gopher snakes occur in all dens and are the only species in some. One particular den studied since 1940 provides data on long-term changes. In 1950, rattlesnakes and whipsnakes (232, 185) were the abundant species, but declined by 1966 (51, 82) and continued to decline through 1971 (15, 48). Racers and gopher snakes increased from negligible numbers in 1950 to 64 + 10 in 1966 and 158 + 36 in 1971. Total snake biomass in this den has been reduced from ca. 73 kg in 1950 to ca. 25 kg in 1971. Human predation may be responsible for the dramatic reduction in numbers of rattlesnakes and whipsnakes since 1950. Recruitment of racers and gopher snakes from adjacent dens in the complex may account for their increase.

RICKRODE, THOMAS, CHARLES F. MUELLER AND DAVID TAYLOR. (Slippery Rock—State College)

Fatty acid composition of the dermal secretions of Plethodon cinereus.

Twenty-four different methyl esters were found in the dermal secretions of Plethodon cinereus by means of gas liquid partitioning chromatography. Fifteen of the twenty-four methyl esters have been identified by comparison with twenty-two standards. Myristate (8.9%), palmitate (11.7%), oleate (10.2%) and stearate (8.3%) were present in the largest percentages. Eight methyl esters each comprised less than one percent of the total sample. Seventy percent of total methylated fat was identified. Future work will center on the determination of the existence of free fatty acids in the dermal secretions and identification of the unidentified methyl esters.

ROSSMAN, DOUGLAS A. (La. St. U.), W. GARY EBERLE (La. St. U.), SHOU-HSIAN MAO (Nat. Defense Med. Center, Taiwan), HEBERT C. DESSAUER (La. St. U. Med. Center), and EDMOND V. MALNATE (Phila. Acad. Sci.). Relationships of the water snakes (genus Natrix): A progress report.

Previously reported evidence from transferrins indicated the existence of at least 3 distinctive species groups. Karyotypic data substantiate these findings. Asian species are characterized by 2N=42 (FN=48), 6 pairs of acrocentrics, 3 pairs of meta- or submetacentrics, and 12 pairs of microchromosomes. In this respect they appear to be somewhat closer to other Asian natricine genera such as Xenochrophis and Rhabdophis than to either European or North American Natrix, both of which have considerably reduced, although rather dissimilar, chromosome complements [Europe: 2N=34 (FN=50), 8 pairs of meta- or submetacentrics, and 9 pairs of microchromosomes; North America: 2N=36 (FN=72), and 18 pairs of meta- or submetacentrics]. North American Natrix have a karyotype identical with that of the other 8 New World natricine genera, which implies a very close relationship among them--certainly a closer relationship than these Natrix share with their Old World congeners. Karyotypic and transferrin evidence pointing to the generic separation of North American, European, and Asian Natrix, is supported by certain features of the hemipenis and scutellation. Although transferrin and karyotypic data are not yet available for African Natrix, osteological, hemipenial, and scale characteristics indicate that this group also is quite distinctive.

TAYLOR, DOUGLAS H. and KRAIG ADLER. (Miami University and Univ. Notre Dame). Shoreline imprinting in the tiger salamander (Ambystoma tigrinum).

Tiger salamanders trained in aquatic tanks with a shoreline at one end exhibited a Y-axis orientation when tested in circular test arenas open only to celestial cues. As larvae they moved on a compass course which would have returned them to deep water had they been in the training tank. Upon metamorphosis, their orientation shifted by 180 degrees (toward land had they been in the training tank). Salamanders trained as larvae but transferred from the training tank to shoreless circular wading pools shielded from celestial cues, but under a normal photoperiod, continued to shift their orientational responses by 180 degrees upon metamorphosis. This indicates a learning process (possibly imprinting) which is unaffected by the gross physiological and structural changes taking place during metamorphosis.

THUROW, GORDON R. (Western Ill. Univ.). Salamander intraspecific and interspecific territoriality and social dominance, and their significance for interspecies competition.

Salamander territoriality was clearly described once, in 1955, for terrarium animals. Published suspicions of field occurrence followed. Amphibian social dominance hierarchy has been reported, but only as calling sequence in breeding male frogs. In this study, Plethodon glutinosus, P. ouachitae, and P. caddoensis were placed in terraria, individually identified, and observed for months and years. Display, challenge or threat, attack, and appeasement behavior were observed in males, females, and immatures. Many poses and movements were used as communication between, as well as within, the three species. Territoriality and social dominance have significance in interspecies competition here, since food and shelter uses overlap. In Oklahoma and Arkansas, P. glutinosus is sympatric with both P. ouachitae and P. caddoensis. Feeding competition and shelter-object competition were observed between these species pairs, and even differential survival between P. glutinosus and P. ouachitae. Plethodon glutinosus appears to be the newer animal in sympatric areas, and has less restrictive habitat requirements. Since dominance is mainly by size, the largest species, P. glutinosus, appears to have the advantage. Two short films illustrate some of the behavior.

WERNER, J. KIRWIN. (No. Mich. Univ.). Geographic variation in muscle proteins from Cynops sp. in Japan and the Ryukyu Islands.

A geographic comparison of muscle proteins as resolved by disc electrophoresis was made between populations of Cynops pyrrhogaster on Honshu and Kyushu, Japan and Cynops ensicauda from Amami-Oshima and Okinawa, Ryukyu Islands. Although closely related but disjunct populations on Honshu could not be differentiated, inter-island populations were easily distinguishable. Qualitative and quantitative variation in proteins within a single population was evident throughout, but did not override the use of the technique as a systematic tool. The electrophoretic patterns indicated a much greater concordance between the two southern island populations of Amami-Oshima and Okinawa and their distinctiveness from the northern island populations. The differences are discussed relative to the origins of Cynops in Japan and the Ryukyu Islands.

WILEY, EDWARD O. (Sam Houston St. Univ.). The Pleistocene herpetofauna of Dark Canyon Cave, New Mexico.

Dark Canyon Cave, located 10 miles southwest of Carlsbad, New Mexico, has yielded a varied herpetofauna of Late Wisconsian age. Included in the collection were five species of amphibians and twelve species of reptiles. The species represented were: Ambystoma tigrinum, Bufo woodhousei, Bufo compactilis, Rana pipiens, Rana catesbeiana, Phrynosoma douglassi, Sceloporus sp., Crotaphytus collaris, Elaphe gutatta, Pituophis sp., Lampropeltis sp., Arizona elegans, Coluber or Masticophis, Natrix sp., Thamnophis sp., Crotalus atrox, and Agkistrodon (?). The only species not found in the area of the cave today are Phrynosoma douglassi and Agkistrodon. The fossil assemblage is composed of two distinct groups. The first, which includes A. tigrinum, the ranids, Natrix, and Thamnophis, is characteristic of a lake side or stream enviroment. The second, which includes the bufonids, the other colubrid snakes, Crotalus atrox, and the lizards is characteristic of an arid, sandy or rocky habitat. Mixtures of species from different habitats in cave fossil assemblages could be expected if deposition were the result of the actions of wide ranging preditors.

YARKEY, ALEXANDER. (Louisiana State Univ.) Comparative cranial myology of North American natricine snakes.

All muscles examined show considerable individual variation in proportional characters. However, some absolute morphological differences are seen in the origin of the medial mandibular adductor and depressor mandibulae muscles. These differences are not uniformly consistent with currently recognized intrageneric groupings. Myological data from juveniles indicate considerable variation in allometric growth at the intra- and intergeneric levels. A levator anguli oris muscle is present in nearly all natricines, but it varies considerably. The assumption that the presence of this muscle is a primitive characteristic is questionable, and caution should be exercised about giving it much phylogenetic importance. An alternative suggestion is that this muscle evolved independently in several taxa and its development has been suppressed in many stocks. The origin and relative position of the levator anguli oris vary substantially from one taxon to another, and its anatomical homology is far from clear. It appears that the general trend of cranial musculature in the natricines has little to offer in tracing evolution at the species or generic level.

WORTHINGTON, RICHARD D. (Univ. Texas El Paso). Density, growth rates and home range sizes of Phrynosoma cornutum in southern Dona Ana County, New Mexico.

In the summers of 1970-1972, horned lizards, Phrynosoma cornutum, were studied in a Larrea-Yucca community near Anapra, Dona Ana Co., New Mexico. In July, 1971, the density was 1.64 individuals per hectare. Preliminary data on home range size revealed large home ranges measuring up to 1.08 ha (minimum polygon method). Hatchlings were first seen in the fall and were found to increase in s-v length at a rate of 0.6 mm/day during their first summer. Lizards larger than 90 mm s-v showed little subsequent growth.

ZUG, G. (Natl. Mus. Nat. Hist.), E. LINDGREN (Wildlife Laboratory, PNG), and J. PIPPET (Wildlife Laboratory, PNG). Ecological observations on Bufo marinus in Papua-New Guinea.

Bufo marinus, the marine toad, has been purposely and fortuitously introduced on many of the South Pacific islands. These toads are extremely abundant in the Port Moresby area and have enabled us to examine, in an elementary way, the population dynamics and dispersal ability of this introduced species. The current distribution and relative abundance in different habitats of marinus indicate that it can only invade successfully natural occurring grasslands or savannahs and man-disturbed habitats. Rainforest appears to be a barrier to dispersal. Although individuals along the margin of the rainforest are larger and have an insectivorous diet, their density is extremely low. In contrast, the marinus density in eucalyptus savannah is high, but the toads are smaller and omnivorous.

REPRODUCTION IN CAPTIVE TRANS-PECOS RATSNAKES, Elaphe subocularis

Although various species of the snake genus Elaphe are commonly bred in captivity, few records exist on the breeding of Elaphe subocularis, which has a restricted range in the southwestern United States and northern Mexico (Dowling, 1957). An instance of captive breeding is reported.

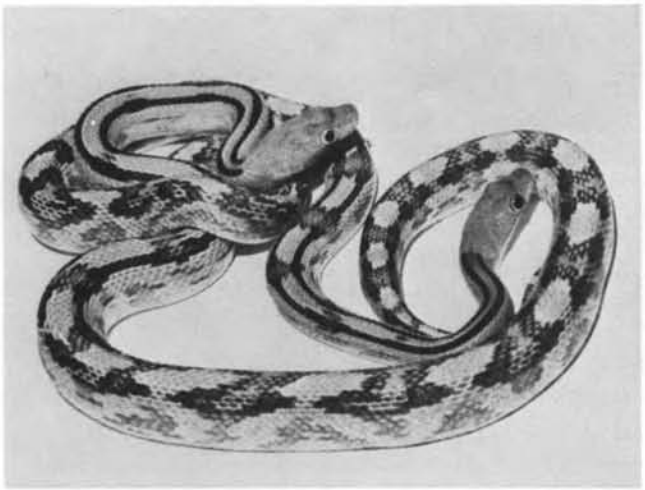
A male E. subocularis (total length 112 cm) was placed in an exhibit with a female (total length 140 cm) on 28 March 1971. The enclosure measured 38 cm x 54 cm x 92 cm. An aquarium gravel substrate was used and rocks and bark were arranged to provide cover for the snakes. The male was from an unknown locality and had been in captivity for only two weeks. The female had been collected one mile north of Big Bend National Park entrance on Highway 385, Brewster Co., Texas, on 24 June 1966. No breeding activity was ever observed and it is thought that mating occurred during the night. On 29 May, the female last accepted food, although previously the snake had been feeding regularly. On 8 July, an egg was laid at 1:00 PM. Five more eggs were laid during the day of 9 July, and the following day one egg was found during the routine morning check. All of the eggs appeared soft and leathery; however, four had an off-white and somewhat yellowish color. The other three eggs were bright white. A description of the eggs is presented in Table I.

TABLE I. Dimensions and Weights of Seven Elaphe subocularis eggs.

Egg	Width	Length	Weight	Color
1	3.0 cm	5.0 cm	27.7 gm	yellow
2	2.9	5.6	29.1	white
3	2.9	5.1	27.3	yellow
4	2.8	5.9	30.4	yellow
5	2.7	5.7	29.3	white
6	2.7	5.2	23.8	yellow
7	2.7	4.8	23.0	white

The eggs were incubated in plastic bags of approximately one gallon capacity sealed at the top with rubber bands, as described by Zweifel (1961). A mixture of Vermiculite (expanded gypsum) and water in the ratio of 1 oz. by weight to 1 fluid oz. of water was used as the incubating medium. The eggs were completely covered. The temperature inside the bags was allowed to fluctuate daily between 24 and 30 degrees C (75 and 86 degrees F). The bags were opened once a week to check the appearance of the eggs and to freshen the air.

On 19 July, egg #4 was removed and opened. The contents inside were solidified and yellowish. On 24 July, the six remaining eggs were noticeably beginning to "sweat" and a slight reddish discoloration was visible on top. On 15 August, eggs 1, 3, and 6 were discarded as they had become discolored and shriveled. On dissection they appeared the same as egg #4. Although weekly feeding had resumed several weeks after egg laying, the female E. subocularis, which had been in captivity for over five years, had died unexpectedly on 13 August.



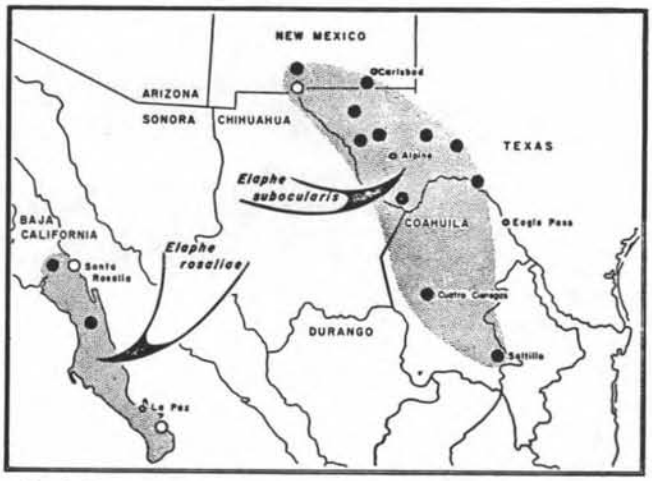


FIG. 1. Two juvenile individuals of Elaphe subocularis eight months after hatching.

On 23 September, after a period of 86 days, egg #2 hatched. Three days later, on 26 September, egg #7 hatched. The remaining egg #5 was opened on 27 September and found to contain a dead, deformed embryo. The patterns and coloration of these juveniles conformed fairly well with the description given by Dial (1965).

The lengths and weights of the two viable snakes on the dates of their respective hatchings are presented in Table II.

MAP 1. Known geographic distribution of the two members of the Rosaliae Section. Solid spots indicate specimens examined; open circles, literature records. Shaded areas show the general regions from which specimens have been taken and are not intended as predictions as to the actual limits of the ranges of these species.

(From Dowling, 1957.)

FIG. 2. Juvenile individual of Elaphe subocularis eight months after hatching. Scale in centimeters.

TABLE II. Weights and Lengths of Hatchlings of Two E. subocularis.

	Weight	Length
#2	14.7 gm	28 cm
#7	13.8 gm	29 cm

Both of the young snakes shed ten days after hatching, on the third and sixth of October, and began feeding on newborn mice on 13 October. After this date they were fed one small mouse each per week. On 25 May 1972 their weights and lengths had increased as presented in Table III.

TABLE III. Weights and Lengths of Juveniles Eight Months after Hatching.

	Weight	Length
#2	31.2 gm	42 cm
#7	28.7 gm	34 cm

I am indebted to the staff of the Fort Worth Zoological Park for helpful comments in preparing this article.

THE STRIPED MUD TURTLE (KINOSTERNON BAURI GARMAN) IN SOUTH CAROLINA

Michael Duever

A collection of mud turtles from the Atomic Energy Commission Savannah River Plant (SRP) near Aiken, South Carolina included several individuals of the striped mud turtle (Kinosternon bauri). This species has not been recorded outside of Florida until recently, when it was found along the south Georgia coast (Wharton and Howard, 1971). The SRP collection contains 56 common mud turtles (Kinosternon subrubrum) and 5 other mud turtles which show characteristics typical of K. bauri. Harry W. Freeman (pers. comm.) collected 20 of these specimens between 1952 and 1957, including one juvenile K. bauri. I collected the remaining 41 specimens between 1965 and 1968, four of which are K. bauri. Freeman's specimens are presently in the collection of the Charleston Museum, and mine are in the collection of the University of Georgia Museum of Zoology.

Uzzell and Schwartz (1955) described K. bauri as having a carapace coloration varying from an almost uniform light brown (unpigmented) to one that is dark brown, with or without three distinct light dorsal lines. The dorsal lines are virtually indiscernible in the unpigmented forms, and lightened areas marking the positions of the underlying bony sutures may be visible through the unpigmented laminae. They describe the head coloration as a varying from gray to black, with or without sharply-defined canthal and angular stripes. Of the five K. bauri from the SRP, one adult female (UG 2405) has three poorly-developed shell stripes, while two individuals (UG 2406-2407) have only a poorly-developed mid-dorsal stripe. The other two individuals (UG 2404 and CM 211), including the juvenile, have no shell stripes. All have light brown shells with lighter areas indicating the positions of the bony sutures. The head pattern on all five individuals is composed of distinct canthal and angular stripes on a predominately black background.

The SRP K. subrubrum show no indication of shell stripes. The head pattern varies and, in a few cases, approaches that of K. bauri. Examination of the head patterns of the 56 K. subrubrum reveal what appear to be four major types: no yellow (1 individual), scattered head spots (33 individuals), angular head stripe with few-to-many head spots (13 individuals), and elongate head spots (9 individuals). Thus there appears to be a continuum between these two species of mud turtles so far as head and shell striping characteristics are concerned. In an effort to further differentiate these two populations of mud turtles, a number of shell measurements were made including carapace length and width, and shell height. A comparison of the proportions of all combinations of these measurements showed no distinct differences between species.

Kinosternon bauri on the SRP is restricted to the bald cypress-tupelo gum swamps bordering the Savannah River, while K. subrubrum is widely distributed in all aquatic habitats. Despite the distance involved, the presence of K. bauri is not unexpected since the lowland habitats and herpetofauna (Duever, 1967) found on the SRP have much in common with those of northern and central Florida.

ACKNOWLEDGEMENTS

UNIONE ERPETOLOGICA ITALIANA

The "Unione Erpetologica Italiana" (Italian Herpetological Union) was founded in September 1967 by Avv. A. Grimaldi and Count A. Pallavicini with the purpose of obtaining from Institutes and Museums, as an Association, those species of reptiles and amphibians which, as private individuals, they had never succeeded in acquiring, and to obtain permits to import exotic species. At the end of 1968 the Union numbered 18 Associates, all Romans, who concentrated mainly on keeping, breeding, and observing captive reptiles and amphibians.

In 1968 Silvio Bruno joined the Union and regular meetings among Associates began to be held in his home. During this period the number of Associates grew to 46. After both Founder Members passed away in the winter of 1970, the Union moved to new quarters in the Museum of Zoology, thanks to the generosity of the Administration of the Zoological Garden of Rome. Here the Union initiated activities on a wider national scale, including the publication of an Information Bulletin.

Today, the number of Italian members has grown to 170 and the Bulletin is visible in most institutes of zoology, natural history museums, and in private and public institutions and cultural associations interested in natural history and nature conservation both in Italy and abroad. The aim of the Union today is to contribute with studies, research, publications, and other activities, to the increase of interest in herpetology and its problems in Italy, and to gather a large number of interested herpetologists with whose help it will be possible to give proper attention to the rich Italian herpetological fauna. The Union publishes an information Bulletin printed in offset three times a year, with an annual total of 100 pages, as well as special subject monographic issues.

Members, in addition to receiving all publications of the Union and to having the right to publish all their interesting observations in the Bulletin, have the advantage of obtaining, for reimbursement of expenses, live reptiles and amphibians from all over the world. They can also obtain books, prints, and postcards of herpetological subjects, as well as being able to attend conferences, movies, meetings, herpetological trips, and eco-ethological studies. The Union endeavours to create herpetological refuges in favourable locations, seeking the collaboration of the respective owners, in order to protect the species of reptiles and amphibians which live in habitats of particular interest and subject to little or no alteration by man.

The address of the Association is: Unione Erpetological Italiana, Via Ulisse Aldrovandi 18, Museo Civico di Zoologia, 00197, ROMA.

JOINT CONSERVATION COMMITTEE ESTABLISHED

Ecological crises affecting populations and even entire species of reptiles and amphibians, or significant portions of their habitat, are increasing in frequency at an alarming rate. As pressures from human population growth inexorably increase, with resulting environmental pollution and degradation, these crises can only increase in both frequency and severity. The recent establishment of a conservation committee by the Herpetologists' League, paralleling similar action by the Society for the Study of Amphibians and Reptiles, is an important event. The members of both committees are herpetologists with great expertise and experience in conservation matters, and we are certain that the herpetological community can look forward to wise counsel and sound leadership in the field of conservation.

We recognize, however, that most conservation problems will be of concern to the members of both societies, and that mobilization of the greatest possible amount of support will be essential for success in environmental warfare. Therefore, we have asked the members of these two committees to coordinate their activities, and to function as a JOINT CONSERVATION COMMITTEE. We hope that there will be full and free communication between all committee members on matters of common interest, and that this will provide a broad base for any general appeal for support or action in the field of herpetological conservation.

Recent experience suggests that immediate and voluminous publicity and free flow of information are the keys to stalling or reversing environmental crises. To open a channel for information flow, both to the Joint Committee and to the members of the societies, we have asked Bruce Bury to serve as Conservation Editor for Herpetological Review. We hope that the members of HL and SSAR will take every opportunity to communicate information of importance in the conservation field to the Joint Committee, for general dissemination to the societies and for action by the members.

T. Paul Maslin, President
Herpetologists' League

C. J. McCoy, Chairman
SSAR

Members of the Joint Conservation Committee:

HL Members: R. Bruce Bury, Laurence M. Hardy, Glenn R. Stewart

SSAR Members: Glenn Gentry, N. Bayard Green, M. Graham Netting

REPTILES, AMPHIBIANS, AND THE LAW

H. Bernard Bechtel and Elizabeth Bechtel

There are a considerable number of local, state, and national laws pertaining to reptiles and amphibians. These laws are, or should be, of interest to herpetologists, and herpetologists ought to be aware of existing legislation pertaining to their special interests. With the present concern about deterioration of the environment and the depletion of wildlife and wildlife habitat to the point that some reptiles and amphibians are endangered as a species, this appears to be a timely opportunity to bring together the known legislation in one compact form. It will also prove a base line against which to compare the changing legislation as other laws are enacted or existing laws are amended or repealed. Furthermore, with passing time, there is more protective legislation and the field biologist, with the rapid and simple access to collecting sites in all parts of America, should have a convenient place to familiarize himself with the laws so that he may avoid breaking the law and so that he may make arrangements ahead of time for such things as obtaining needed collecting permits.

This preliminary listing, for publication in the HERPETOLOGICAL REVIEW, is merely to acquaint the readers with a scope of the laws which presently exist. It is contemplated that a completed paper, with the information in a complete form, will be published in the 1972 YEARBOOK OF HERPETOLOGY. This preliminary listing will give the readers a chance to acquaint the authors with laws which have been omitted and which may be of significance. The amassing of these laws is somewhat hit-and-miss, as there must be innumerable local regulations pertaining to such things as venomous reptiles in captivity, selling of reptiles to minors, keeping reptiles in the home, and cruelty to animals. These can be added to the final paper as they are brought to the attention of the authors and authenticated.

The following listing is not meant to include the reproduction of any laws. It is merely an overview of existing legislation.

ALABAMA

All Animals. All animals are protected in Wildlife Management Areas.

Alligator (Alligator mississipiensis). Alligators are classified as game animals, with no open season.

ALASKA

ARIZONA

Bullfrog (Rana catesbeiana). The taking of bullfrogs is regulated under the Arizona Fishing and Reptile Regulations.

Amphibians (except bullfrogs). The taking is regulated under the Arizona Fishing and Reptile Regulations.

Softshell Turtle (Trionyx s. emoryi). The taking is regulated under the Arizona Fishing and Reptile Regulations.

Ridge-nosed Rattlesnake (Crotalus willardi), Twin-spotted Rattlesnake (Crotalus pricei), and Rock Rattlesnake (Crotalus l. klauberi). The taking and possession regulated by the Arizona Game and Fish Department.

Horned Lizards (Phrynosoma) and Desert Tortoise (Gopherus agassizi). Protection and possession limit regulated under the Arizona Fishing and Reptile Regulations.

Gila Monster (Heloderma suspectum). May be killed, captured, or possessed only with special permit from Arizona Game and Fish Department.

Live Wildlife. Capture and possession of live wildlife regulated by the Arizona Game and Fish Department.

ARKANSAS

Frogs. Taking of frogs regulated by the Arkansas Game and Fish Commission.

Turtles. Taking of turtles regulated by the Arkansas Game and Fish Commission.

Alligator (Alligator mississipiensis). Protected.

CALIFORNIA

Frogs. Taking regulated by the Department of Fish and Game.

Endangered Amphibians. Desert Slender Salamander (Batrachoseps aridus), Santa Cruz Long-toed Salamander (Ambystoma macrodactylum croceum). Protected.

Endangered Reptiles. Blunt-nosed Leopard Lizard (Crotaphytus silus) and San Francisco Garter Snake (Thamnophis sirtalis tetrataenia). Protected.

Rare Amphibians. Kern Canyon Slender Salamander (Batrachoseps simatus), Tehachapi Slender Salamander (Batrachoseps stebbinsi), Limestone Salamander (Hydromantes brunus), Shasta Salamander (Hydromantes shastae), Siskiyou Mountain Salamander (Plethodon stormi), and Black Toad (Bufo exsul). Protected.

Rare Reptiles. Southern Rubber Boa (Charina bottae umbratica), Alameda Striped Racer (Masticophis lateralis euryxanthus), and Giant Garter Snake (Thamnophis couchi gigas). Protected.

Desert Tortoise (Gopherus agassizii). Protected. Taking regulated by Fish and Game Code.

Diamond-back Terrapin (Malaclemys). Protected.

COLORADO

CONNECTICUT

Rattlesnake (Crotalus horridus) and Copperhead (Agkistrodon c. mokeson). Towns authorized to enact bounties.

Snakes. Towns authorized to enact ordinances regulating keeping and exhibition of snakes.

DELAWARE

Alligator (Alligator mississipiensis), Crocodile (Crocodylus acutus), and Caiman (Caiman sclerops). Traffic in skins controlled under state endangered species act.

FLORIDA

Frogs. Taking regulated by Florida Fishing Regulations.

Turtles. Taking regulated by Florida Fishing Regulations.

Alligator (Alligator mississipiensis), Crocodile (Crocodylus acutus), and Caiman (Caiman sclerops). Protected.

Pine Barren Tree Frog (Hyla andersoni). Protected.

Indigo Snake (Drymarchon c. couperi). Protected.

Poisonous snakes. Exhibiting and caging regulated by the Florida Game and Fresh Water Fish Commission.

GEORGIA

Alligator (Alligator mississipiensis). Protected.

Sea Turtles. Atlantic Green Turtle (Chelonia m. mydas), Atlantic Hawksbill (Eretmychelys i. imbricata), Atlantic Loggerhead (Caretta c. caretta), Atlantic Ridley (Lepidochelys kempi), and Atlantic Leatherback (Dermochelys c. coriacea). Turtles and eggs protected.

IDAHO

Bullfrog (Rana catesbeiana). Taking regulated by Idaho Fish and Game Department.

ILLINOIS

Frogs. Taking regulated by Illinois Fishing Regulations.

Bullfrog (Rana catesbeiana). Use of firearms banned.

INDIANA

Frogs. Taking regulated by Indiana Hunting and Fishing Regulations.

Turtles. Taking regulated by Indiana Hunting and Fishing Regulations.

IOWA

Frogs. Taking regulated by Iowa Fishing Laws.

Turtles. Taking regulated by Iowa Fishing Laws.

Bullfrog (Rana catesbeiana). Taking regulated by Iowa Fishing Laws.

KANSAS

Bullfrog (Rana catesbeiana). Taking regulated by Kansas Anglers Guide.

KENTUCKY

Frogs. Taking regulated by Kentucky Fishing Regulations.

Salamanders. Taking for bait regulated by Kentucky Fishing Regulations.

Reptiles. Banned for use in religious ceremonies.

LOUISIANA

Frogs. Taking regulated by Louisiana Fishing Regulations.

Diamondback Terrapin (Malaclemys t. pileata). Taking regulated by the Louisiana Fishing Regulations.

Alligator (Alligator mississipiensis). Taking regulated by Louisiana Wildlife and Fisheries Commission.

MAINE

Poisonous Snakes. Possession of poisonous snakes regulated by state law.

MARYLAND

Endangered Species. There is a state endangered species law.

Snapping Turtle (Chelhydra s. serpentina). Taking regulated under an act in the Annotated Code of Maryland.

Terrapins (Malaclemys t. terrapin). Taking regulated under an act in the Annotated Code of Maryland.

Poisonous Snakes and Large Snakes. Keeping and display regulated by a Baltimore City Ordinance.

MASSACHUSETTS

MICHIGAN

Frogs. Taking is regulated by Department of Natural Resources.

Turtles. Taking is regulated by Department of Natural Resources.

MINNESOTA

Frogs. Taking is regulated by Department of Natural Resources.

MISSISSIPPI

Alligator (Alligator mississipiensis). Protected.

Frogs. Taking is regulated by the Game and Fish Commission.

Turtles. Taking is regulated by the Game and Fish Commission.

MISSOURI

Bullfrog (Rana catesbeiana). Taking regulated by rules in Missouri Wildlife Code.

Other Frogs. Taking regulated by rules in Missouri Wildlife Code.

Turtles. Taking regulated by rules in Missouri Wildlife Code.

MONTANA

NEBRASKA

Bullfrog. (Rana catesbeiana). Taking is regulated by the Nebraska Fishing Guide.

NEVADA

Bullfrog. (Rana catesbeiana). Taking is regulated by Nevada Fishing Regulations.

Reptiles. Covered in state legislation regulating maintenance of zoos, menageries, and wild animal collections.

NEW HAMPSHIRE

NEW JERSEY

Reptiles. Covered in state regulations banning cruelty to animals.

NEW MEXICO

Bullfrog. (Rana catesbeiana). Taking is regulated by New Mexico Department of Game and Fish.

NEW YORK

Box Turtle (Terrapene c. carolina), Wood Turtle (Clemmys insculpta), and Bog Turtle (Clemmys muhlenbergi). Protected.

Frogs. Taking is regulated under New York Fishing Regulations.

NORTH CAROLINA

Alligator. (Alligator mississipiensis). Protected.

Green Turtle (Chelonia m. mydas), Hawksbill Turtle (Eretmychelys i. imbricata), Loggerhead Turtle (Caretta c. caretta), and Leatherback Turtle (Dermochelys c. coriacea). Taking of these turtles or their eggs is regulated under the provisions of a North Carolina General Statute.

NORTH DAKOTA

Reptiles and Amphibians. Included under provisions of statewide law concerning humane treatment of animals.

OHIO

Frogs. Taking is regulated by Ohio Fishing Regulations.

Turtles. Taking is regulated by Ohio Fishing Regulations.

OKLAHOMA

OREGON

PENNSYLVANIA

Frogs. Taking is regulated by Pennsylvania Fish Laws.

Turtles. Taking is regulated by Pennsylvania Fish Laws.

RHODE ISLAND

SOUTH CAROLINA

Alligator (Alligator mississipiensis). Protected.

Carolina Diamondback Terrapin (Malaclemys t. centrata). Taking is regulated by state law.

Green Turtle (Chelonia m. mydas), Hawksbill Turtle (Eretmychelys i. imbricata), Loggerhead Turtle (Caretta c. caretta), Ridley Turtle (Lepidochelys kempi), and Leatherback Turtle (Dermochelys c. coriacea). Sale of the turtles or their eggs banned by state law.

SOUTH DAKOTA

Frogs. Taking is regulated by the South Dakota Fishing Regulations.

TENNESSEE

Bullfrog. (Rana catesbeiana). Taking is regulated by the Tennessee Fishing Guide.

Turtles. Taking is regulated by the Tennessee Fishing Guide.

TEXAS

Alligator (Alligator mississipiensis). Protected.

Horned Toads (Phrynosoma). Protected.

Texas Tortoise (Gopherus berlandieri) and Gopher Tortoise (Gopherus polyphemus). Protected.

UTAH

Desert Tortoise (Gopherus agassizi) and Gila Monster (Heloderma suspectum). Under jurisdiction of the Division of Wildlife Resources and may be "protected wildlife."

VERMONT

VIRGINIA

Frogs. Taking is regulated by Virginia Fish and Game Laws.

Turtles. Taking is regulated by Virginia Fish and Game Laws.

Snakes. Display, exhibit, and handling regulated by state code.

Reptiles and Amphibians. Included generally in state code provisions banning cruelty to animals.

WASHINGTON

Bullfrog (Rana catesbeiana). Taking is regulated in the Fish Regulations.

Western Washington Turtles (ALL). Western Pond Turtle (Clemmys mormorata), Painted Turtle (Chrysemys picta), and Pacific Green Turtle (Chelonia m. agassizi). Protected.

Venomous Reptiles. State law upholds right to destroy venomous reptiles.

WEST VIRGINIA

WISCONSIN

Frogs. Taking is regulated by Wisconsin Fishing Regulations.

Turtles. Included with "rough fish" and the taking is regulated by Wisconsin Fishing Regulations.

WYOMING

AMERICAN SAMOA

GUAM

All Reptiles. Included under classification of unprotected wildlife.

HAWAII

All Snakes. Importation prohibited.

PUERTO RICO

VIRGIN ISLANDS

Green Turtle (Chelonia m. mydas), Hawksbill Turtle (Eretmychelys i. imbricata), Loggerhead Turtle (Caretta c. caretta), Ridley Turtle (Lepidochelys kempi), and Leatherback Turtle (Dermochelys c. coriacea). Hunting of female turtles and collecting of turtle eggs regulated by hunting regulations.

UNITED STATES

All Reptiles and Amphibians. Protected in National Parks.

Reptiles and Amphibians (Varying Species As Determined To Be Endangered). Protected under the Endangered Species Conservation Act and the Lacey Act.

ACKNOWLEDGEMENTS

The authors are indebted to Arden H. Brame (Eaton Canyon Nature Center), Frank Groves (Baltimore Zoo), Sherman Minton (Indiana University School of Medicine) and Horace G. Staffort (Michigan Herpetological Society) for correspondence calling attention to legislation affecting reptiles and amphibians.

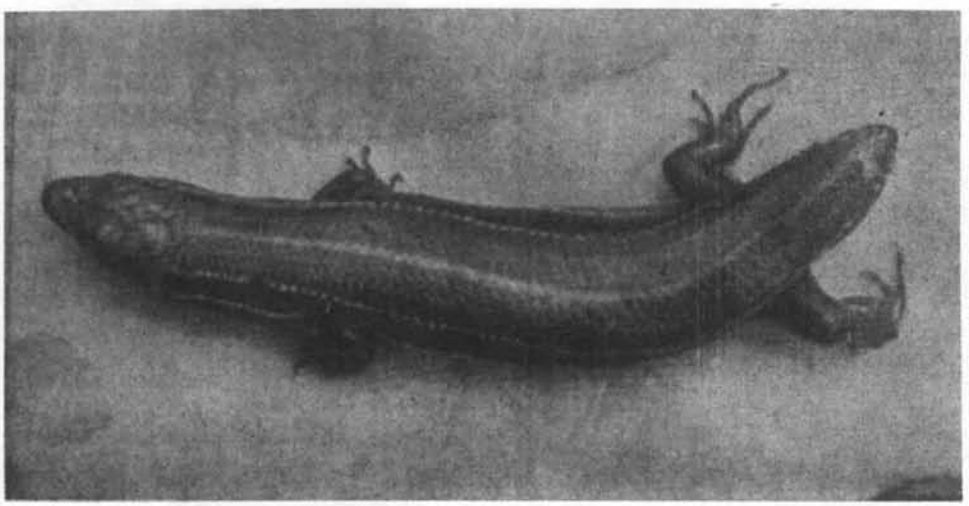
Valdosta, GA 31601

ASIH Resolution No. 3. 1971.

"WHEREAS, continuing environmental deterioration and various forms of exploitation are threatening the survival of increasing numbers of fishes, amphibians, and reptiles; and

"WHEREAS, nearly three hundred species and subspecies of these animals are now considered by the International Union for Conservation of Nature and Natural Resources, and by national and state governments, to be endangered, rare, or depleted; and



"WHEREAS, there is a growing public awareness of the need to preserve a diversity of animals both to maintain an ecological balance and for their scientific, aesthetic, and economic values; and

"WHEREAS, the American Society of Ichthyologists and Herpetologists is an organization whose members are dedicated to the scientific study of fishes, amphibians, and reptiles; and

"WHEREAS, carelessly conducted studies and a lack of proper concern for the animals of interest to members of this Society may contribute to the depletion or extinction of certain species, subspecies, and populations of these animals; now, therefore,

"BE IT RESOLVED, that the American Society of Ichthyologists and Herpetologists, meeting in Los Angeles, California, June 18, 1971, urges its members to observe the following guidelines on responsibility in the conduct of their research and other professional activities:

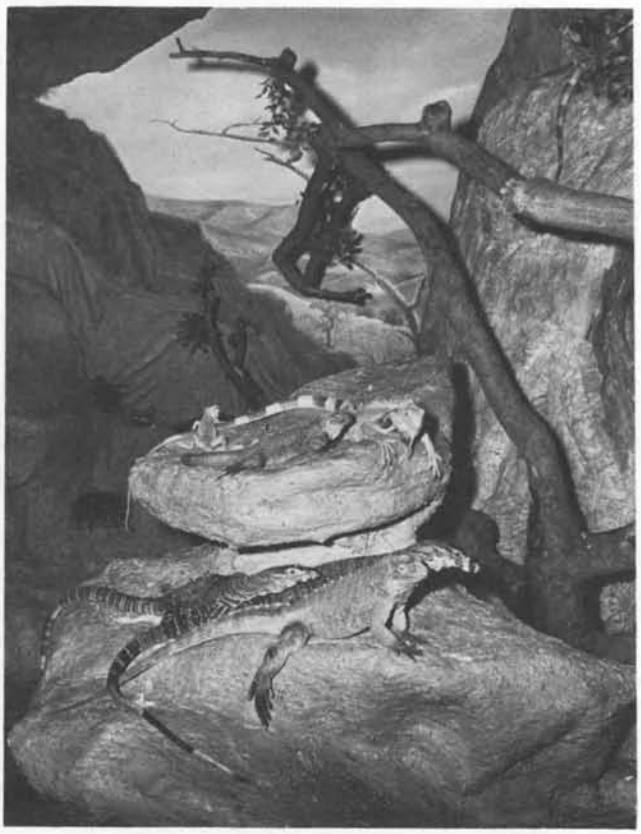
1. Sample only enough specimens to satisfy reasonable scientific requirements.
2. Take individuals of species or subspecies believed to be endangered or rare only if such animals are likely to make a substantial contribution to knowledge in the investigator's discipline or to an understanding of the animal's survival.
3. Exercise equal restraint in collecting individuals of species or subspecies, and in taking animals from isolated populations.
4. Deposit collections in museums where they will be properly preserved and available for study by others.
5. Do not over-exploit populations and do not patronize commercial collectors or dealers who regularly keep in stock excessive numbers of unordered specimens or who knowingly sell rare and endangered animals.
6. Make every effort to minimize the impact that collecting and other activities may have on the habitat.
7. Share the results of studies with appropriate state and federal agencies, amateur groups, and other interested people, as well as as with colleagues and students.
8. Seek to promote a conservation ethic among colleagues, students, amateur groups, and others with whom contacts are made.
9. Do not transfer animals from one habitat to another until after careful study has been made of the potential impact on the native biota. Whenever an introduction is made it should be recorded in the public record.
10. Collect only after securing required permits from concerned governmental agencies and/or after permission from the land owner." -- COPEIA 1971(4).

(Press-AP Photo)

IT'S FOR REAL! — This is actually a two-headed skink. The lizard-like creature was found in a driveway in Jacksonville, Fla., this week and an expert at Jacksonville Zoological Society said, while he had heard of such creatures before, both heads were at the same end. When this one tries to run, the legs worked in opposite directions.

The Press, Atlantic City — Saturday, June 3, 1972

When imagination runs away... Skink with partly-regenerated tail. -- HGD.



L E F T

The new Reptile House, constructed of cinder blocks, faced with stucco, measures 173 x 126 x 44 feet. Work was begun on the million-dollar building in 1969 and was finished nearly three years later. The two entrances are stone and the roof is made of asbestos shingles and terne metal. The public areas are air-conditioned. Guarding the southern entrance is a statue of a Trachodon, the first dinosaur to be discovered in the United States -- at Haddonfield, New Jersey. It was sculpted by Dexter Jones.

B E L O W

You can't keep a good lizard down -- especially in the new building's large Lizard Exhibit, where the beautifully patterned reptiles spend most of their day climbing the fiberglass rocks. The tree is a real (dead) one with artificial leaves added. Several species of lizards, including iguanas, tegus, and monitors, live side by side with small to medium-sized tortoises. The Exhibit is a replica of a xeric, or desert to semi-arid, region. This enclosure, like the others in the new edifice, is landscaped with remarkable fidelity to correspond with the animals' natural habitat.

THE PHILADELPHIA ZOO'S NEW REPTILE HOUSE OPENS

After more than two years of construction and the installation of dozens of naturalistic habitat settings, most of them of fiberglass, the Philadelphia Zoo's new Reptile House opened to the public on Saturday, March 11. More than 400 specimens, representing 275 species, ranging from a 3-inch banded gecko to an 11-foot, 485-pound American crocodile, are in their new enclosures.

The 89 exhibition areas that house the collection were designed and prepared by the Zoo's Exhibits Department, under the direction of Kenneth D. Dills. One of the highlights of the new building is the Tropical River Exhibit, home of a dozen crocodiles. This includes a big ceiba tree and masses of tropical vegetation, a waterfall, and a realistic replica of a thunder shower, complete with thunder, lightning, gradually increasing darkness, frog calls, wind, mist, and rain. The thunder shower is electronically controlled and takes place several times on each busy day.

The building, which cost more than $1,000,000 to construct, was made possible in large part by a grant of $800,000 from the City of Philadelphia under its Capital Improvement Program.

WASHINGTON MEETING

of the

HERPETOLOGISTS' LEAGUE

28 - 29 DECEMBER 1972

CALL FOR PAPERS

Papers on any herpetological subject are welcome. We would prefer that papers presented orally refer to work in progress or nearing completion. Presentation of results that have been published or that are in press usually are a waste of time for both author and audience.

Ordinarily we would expect an author to present no more than one paper, nor to request more than 15 minutes for its presentation. Exceptions will be considered, however.

An abstract of no more than 200 words must accompany this form to qualify for inclusion in the program (see other side). If an abstract is not received, the paper will be treated as a "title only" contribution.

PLEASE NOTE THE DEADLINE: 1 OCTOBER 1972
(SEE OTHER SIDE FOR ADDRESS)

(PLEASE PRINT OR TYPE)

TIME REQUIRED: _____ minutes.

EQUIPMENT NEEDED: 2x2" SLIDE PROJECTOR _____
16 MM MOVIE PROJECTOR _____
OTHER: _____

CATEGORY IN WHICH YOUR PAPER SHOULD BE PLACED: Anatomy ( ); Behavior ( ); General Ecology & Life History ( ); Genetics & Populations ( ); Physiology ( ); Techniques ( ); Systematics, Evolution, or Zoogeography ( ); Other ( ).

Is presentation of a paper a requirement for your attendance at the meeting? _____. If yes, does this mean that you will not receive funds or time for travel if your paper is not on the program? _____.

HERPETOL REV 4(4): A AUGUST 1972

A B S T R A C T F O R M

Please type the final copy of your abstract in the form provided below. Use the format indicated in the sample: AUTHOR(S) in capitol letters; (institution) abbreviated in parens; and title. The allotted space is adequate for a 200-word abstract.

USE A CLEAN TYPEWRITER AND GOOD RIBBON. This copy will be offset directly for the published abstract.

An abstract is an abbreviated, accurate representation of a presentation. Make the abstract as informative as possible, so that readers may decide, quickly and accurately, whether they need to obtain additional information. Do not include information given in the title. State the purpose, methods, results, and conclusions, either in that order or with initial emphasis on findings (results and conclusions). Make sure that the taxa of the animals studied are indicated either in the title or the abstract.

Make the abstract self-contained, since it must be intelligible without further information. Be concise without being obscure; retain the basic information and tone of the presentation.

Write most abstracts in a single paragraph. Normally employ complete, connected sentences, active verbs, and the third person. Use nontextual material such as short tables and structural formulas only when no acceptable alternative exists. Employ standard nomenclature, or define unfamiliar terms, abbreviations, and symbols the first time they occur in the abstract.

_____ ZIP _____

The Catalogue of American Amphibians and Reptiles is a series of loose-leaf accounts, each prepared by an expert in the field. The pages are 8 1/2 x 11 inches, and are punched for standard binders. Each one- to four-page account gives a wealth of information about the animal, including common and scientific names (with a synonymy), a definition, a description, information on fossil occurrence, a detailed map of geographic distribution, and a comprehensive introduction to the literature.

The Catalogue is an essential reference for all biologists who use amphibians or reptiles in their research. The loose-leaf format allows individual additions and up-dating, as well as giving the user the option of arranging the accounts in serial, alphabetic, geographic, or taxonomic order.

One hundred twenty-five accounts were published from 1963 - 1971. Another 25 are to be published in 1972. Most of the accounts are on species that occur in the United States and Canada. Because most of the salamanders of this region have been treated in past issues, future accounts will have greater emphasis on frogs and various reptile groups.

PRICE LIST

	INDIVIDUAL	INSTITUTION
THE CATALOGUE: Imprinted Binder, Taxonomic Tabs, Accounts 1 - 125	$22.00	$27.00
IMPRINTED POST BINDER	6.00	6.00
SYSTEMATIC TABS (Ten tabs to fit Binder: "Class Amphibia," "Order Caudata," etc.).	1.50	1.50
CATALOGUE ACCOUNTS 1 - 50	7.50	10.00
CATALOGUE ACCOUNTS 51 - 100	7.50	10.00
CATALOGUE ACCOUNTS 101 - 125	5.00	7.00

Send check and entire sheet to address above.

SOCIETY MEMBERSHIPS AND SUBSCRIPTIONS

Though their numbers are increasing, it is still true that fewer than 60 per cent of the members of the HERPETOLOGISTS' LEAGUE belong also to the SOCIETY FOR THE STUDY OF AMPHIBIANS AND REPTILES. And less than two-thirds of the members of the latter society also belong to the Herpetologists' League. We believe that each of the societies has something important and unique to offer the members of the other. In the interests of a greater combined membership of persons interested in amphibians and reptiles, we invite the members of each society to also join the other.

To ease this process, we offer the "easy-form" membership applications below.

THE SOCIETY FOR THE STUDY OF AMPHIBIANS AND REPTILES

This young society (a 1967 outgrowth of the OHIO HERPETOLOGICAL SOCIETY) offers a number of different publications on amphibians and reptiles.

Its regular publications include the semi-annual JOURNAL OF HERPETOLOGY (about 200 pages per year), the bi-monthly HERPETOLOGICAL REVIEW (about 225 pages per year), and a series of FACSIMILE REPRINTS IN HERPETOLOGY, which is now devoted to reprints of G. A. Boulenger's contributions to American herpetology (about 100 pages per year). In 1971 the Society also assumed sponsorship of the CATALOGUE OF AMERICAN AMPHIBIANS AND REPTILES. Besides these publications, the Societv issues a number of SPECIAL REPRINTS each year.

Membership is open to anyone interested in amphibians and reptiles. All classes of members receive the J HERPETOL, HERPETOL REV, regular issues of FACSIMILE REPRINTS, and all have the same membership privileges. The higher classes of membership aid the Society in improving and expanding its services to its members and to the field of herpetology.

THE HERPETOLOGISTS' LEAGUE

The Herpetologists' League is the elder and the larger of the two societies. It was established in 1936, when the journal HERPETOLOGICA (now in its 27th Volume) began publication.

HERPETOLOGICA appears quarterly, and will publish some 500 pages of papers on amphibians and reptiles this year. By arrangement with the SSAR, the Members and Fellows of the League also receive HERPETOLOGICAL REVIEW.

Anyone with an interest in herpetology is eligible for membership in the Herpetologists' League. The Fellows, who hold the voting rights in the League, are elected by the Executive Council, "on the basis of their contribution to the science of herpetology."

The Members receive HERPETOLOGICA, to which they can submit manuscripts for publication. They may also attend the Annual Meeting, which usually is held in conjunction with the AAAS meetings.

R I G H T

The East African Savanna is the home of these three highly venomous Gaboon vipers. The temperature is kept at 80 degrees and the water between 78 degrees and 80 degrees. All the new exhibits have ventilation to allow the air to circulate. A giraffe would not find the leaves on the vipers' acacia tree very tasty, even though they serve as its principal food in Africa. As real as it seems, the tree is made of fiberglass and polyester resin.

B E L O W

Nine American alligators have a new home in which to loll--the Florida Everglades Exhibit (pictured) in the new Reptile House. The enclosure is a replica of the alligators' natural habitat and has been stocked with live plants indigenous to the area. The heron painted on the wall by the Zoo's Exhibits Department is also found in the Everglades. Eventually, shore birds will be joining these reptiles in their new home. Twice a week, the 'gators are fed a diet of horsemeat, rodents and mackerel, with vitamin and mineral supplements.

CURRENT HERPETOLOGICAL TITLES, XXI: 1971 - 1972

Herpetological Information Search Systems
American Museum of Natural History
New York, New York 10024

We have brought to your attention more than 16,000 current titles in the pages of this journal to date.

The titles of papers appearing in our lists were obtained by regular scanning of about 2500 journals directly and more than 1000 through secondary sources such as Chemical Abstracts Biochemical sections, Current Contents, publishers' catalogs, etc. Theses in English also appear, coming from such sources as Dissertation Abstracts and various academic publications. Abstracts of papers presented at various meetings and symposia are included. A complete list of the journals covered by us is published in Herpetol. Yearb. 1971. The coverage of books and theses in languages other than English is improving because a larger number of our colleagues bring those titles to our attention. Some copies have been mailed directly to us for inclusion in our lists. However, we would still appreciate being made aware of new books, reports, and non-English theses.

We realize that many of the titles listed are marginal to the field of herpetology as customarily defined. Many are published in journals of physiology, pharmacology, cytology, or embryology. Others are from medical journals, state fish and game publications, or pet animal journals. Thus, they are not aimed at an audience of herpetologists. All of them, however, deal in some way with amphibians and reptiles. As such, they may be of interest to at least some readers of HERPETOLOGICAL REVIEW. It seems better to let the reader make the selection from the list, rather than one of our small group deciding that this paper or that -- or this kind of paper -- is of no interest to anyone.

Our present policy, then, is to list the title of any current paper (e.g., 1971-1972) that is concerned with a member of a Recent order of amphibians or reptiles.

HERPETOLOGICAL REVIEW has appeared bimonthly, beginning in 1971. This means that the titles published here will be more current than the previous quarterly issues allowed.

Except for the omission of extinct orders, our list is comparable with that of the Amphibia and Reptilia sections of the Zoological Record, though ours is more comprehensive and considerably more current.

This list contains titles of books and articles that have come to our attention during the period 1 April 1972 through 31 May 1972. HR is computer printed and because of necessary production procedures there is a possibility that on occasion the titles from a single issue of a journal may appear in several issues of HR. Periodical title abbreviations follow the International List of Periodical Title Word Abbreviations (based on the Amer. Nat. Standards Comm. Z39.) (Chemical Abstracts Service, Columbus, Ohio, US.).

Acknowledgements. This list was prepared by the HISS staff: H. G. Dowling, I. Gilboa, I. Palser, and M. Coxe. J. A. Peters of the U. S. National Museum has continued to provide a welcome back-up program to our search of the literature, and G. J. Jacobs of NASA has kept us informed of the many publications and translations resulting from the United States space efforts. The library staff of the Museum have continued to aid our project. Special thanks to the members of the Herpetology Department, AMNH for their aid in cross indexing, which allows us to offer new services. We continue to rely on the advice and aid of James E. Bradley of the University of Rhode Island Computer Laboratory. We also wish to thank the many individuals who have sent us early copies of reprints for inclusion here.

This is contribution Number 40 of the Genera of Reptiles Project, which is supported by the Information Services Program of the National Science Foundation (NSF GN-707).

HERPETOLOGICAL
INFORMATION
SEARCH
SYSTEMS

HISS proposes to continue publication of "Current Herpetological Titles" after the present supporting NSF grant expires in December. However, neither the SSAR nor the Herpetologists' League (and perhaps no unified society) can fully support this portion of the HISS program, which is basic to its other operations. It probably will be necessary, therefore, for HISS to charge individual subscriptions of $10 or $15 in order to continue this service (see the description of coverage in the introductory section on this page).

WE have never assumed that herpetologists or their societies would pay more than a portion of HISS's $100,000 annual budget, but they must give substantial indication of their interest for it to seem worthwhile for us to seek the outside funds necessary for continuing.

WE anticipate that HISS services and publications might produce one-quarter of the budget in 1972, and perhaps one-half of it in 1973. In order to achieve these financial goals, however, we must have more subscriptions to our publications and services, as well as donations of funds from institutions and individuals.

Therefore, we encourage all who feel that the HISS operation should continue to support it both by letter (to HGD) and by subscription to at least one of its several publications and services (see page 156).

H. G. Dowling
HISS Director

CURRENT HERPETOLOGICAL TITLES

Because of NSF support, HISS has been able to produce twenty lists of titles since 1968 which were "free" to members of the SSAR and the HL. Reduced support will result in a deficit in 1972, however, and it seems likely that these productions cannot continue in 1973 without substantial support from individuals. We ask that you indicate your support now. Subscription costs will be based on the number of potential subscribers.

To HISS:

I wish to continue receiving "Current Herpetological Titles" in 1973, and am willing to pay a subscription of $_____ to aid in its continued production. [Please do not pay 1973 subscriptions now. We will bill you.]

Further, I enclose a check for $_____ to give substantial indication of my support of this project, and to help reduce the deficit anticipated in 1972. [Make check to "AMNH: Herpetol. Title"]

SIGNED_____
[No address necessary if your name is on the SSAR or HL mailing list.]

SPECIAL SERVICES

HISS attempts to provide taxonomic data to those who need it. This includes the location of type specimens, copies of original descriptions, and original drawings of features that have taxonomic importance (e.g., hemipenes, skulls, vertebrae).

We also have an "Area Alerting Service," which will give workers quarterly notice of papers that have appeared in his special field of interest (see HR 3(5): T71). Costs are as follows.

Original Description..... $3.00
Original Drawing (one-time use).....$15.00
Area Alerting Service.....$25.00

HERPETOLOGISTS' LEAGUE

All persons interested in herpetology are eligible for membership.

Members receive HERPETOLOGICA (4 issues/year) and HERPETOLOGICAL REVIEW (6 issues/year). They may submit manuscripts for publication in both these journals, and may present papers at the League's Annual Meeting.

HERPETOLOGICA has been published regularly since 1936. All back issues are available.

Member..... $8.00

Fellow (elected).....$10.00

INSTITUTIONAL SUBSCRIPTION to HERPETOLOGICA.....$15.00

R. R. #1, Box 478
Oklahoma City, OK 73111

ADVICE TO AUTHORS

HERPETOLOGICAL REVIEW publishes feature articles that pertain to amphibians and reptiles, the people who study them, and the relevant societies and institutions. It is not intended as an outlet for reporting the results of research on these animals. Articles describing (and/or photographs illustrating) rarities, expeditions, laboratories, societies, museums, and historical articles that pertain to herpetological study are especially welcome.

FORMAT. Manuscripts should be type-written on white bond paper, one side only. All material, including legends for figures and literature cited, is to be double-spaced. Scientific names of genera and species are underlined. Titles should indicate clearly the subject and the animal group(s) included. Use standard abbreviations for journals.

The 1971 YEARBOOK OF HERPETOLOGY (published by HISS) contains a list of American Standard abbreviations for some 2,500 journals. Other publications that will be of assistance in the preparation of manuscripts are:

CATALOGUE OF AMERICAN AMPHIBIANS AND REPTILES (see information on this page).

Common names for North American amphibians and reptiles (COPEIA 1956(3): 172-185).

SCIENTIFIC WRITING FOR GRADUATE STUDENTS, by F. Peter Woodford (Rockefeller Univ. Press, New York, NY 10021). $5.75.

STYLE MANUAL FOR BIOLOGICAL JOURNALS (American Institute of Biological Sciences, 3900 Wisconsin Avenue, NW, Washington, DC 20016). $3.00.

A publication that will be found helpful in planning and producing adequate illustrations is:

A HANDBOOK OF BIOLOGICAL ILLUSTRATION, by Frances W. Zweifel (University of Chicago Press, 58th Street at Ellis Avenue, Chicago, IL 60637).

Line-cuts are photo-offset directly with the text, and should have widths of 4 1/4 inches (one column) or 9 1/4 inches (two columns). Each line of illustration equals six lines of text (full page copy length is 12 3/4 inches). Line cuts are reduced about 25 per cent in processing.

Photographs and drawings reproduced by half-tone plates are handled separately but should be planned for one-column or two-column reproduction.

PAGE CHARGES AND REPRINTS

Authors of articles or reports submitted to H R are asked to contribute toward their publication costs to the extent of $20 per page. This payment is not a prerequisite to publication. However, paid articles receive priority and are likely to appear earlier than others.

Page-charge payments entitle the author to 100 reprints (or tear-sheets) without additional charge. [Additional reprints may be purchased at $5/page/per 100 copies.]

Cost-sharing of this kind allows additional publication without increasing H R's cost to Society members and subscribers. It is, thus, a method of holding dues and subscription rates at their present levels.

CHANGE OF ADDRESS

THE NEWSLETTER ON AMPHIBIANS AND REPTILES...
AND THE PEOPLE WHO STUDY THEM

VOLUME 4, NUMBER 3
JUNE 1972

SOCIETY FOR THE STUDY OF AMPHIBIANS AND REPTILES

The Society was founded in 1958 as the OHIO HERPETOLOGICAL SOCIETY. Following rapid growth of membership and expansion of operations, the organization became the SOCIETY FOR THE STUDY OF AMPHIBIANS AND REPTILES in 1967.

The SSAR encourages the acquisition of knowledge on amphibians and reptiles, and the dissemination of scientific information of these animals. It encourages the conservation of wildlife in general, and of amphibians and reptiles in particular. A major effort is made to achieve closer cooperation and effective communication between amateur and professional workers. (See Third Cover for membership information.)

HERPETOLOGISTS

LEAGUE

The Herpetologists' League is an international organization which was established in 1936 by Major Chapman Grant. It is dedicated to furthering knowledge of the biology of amphibians and reptiles.

In 1971 it had 900 members and fellows (including Life and Honorary members), and more than 400 institutional subscriptions to its journal, HERPETOLOGICA, which has been published continuously since 1936.

All persons interested in herpetology are eligible for membership. (See Third Cover for membership information.)

EDITORIAL

With this issue we will have published 120 pages in HERPETOLOGICAL REVIEW this year -- and I have had to hold back an additional six pages of material to restrict this to a 40-page issue. Thus, there appears to be little question that HR is fulfilling a need in the field.

There seems to be little question either that CURRENT HERPETOLOGICAL TITLES will be separately published next year (assuming that its publication is continued), and that it will cost something extra. The few returns that the editorial in HR 4(2) occasioned have been very favorable, but we will need to hear from a larger segment of the community before a decision on continuing can be made (see page 94).

PHYSIOLOGICAL MISCELLANEA makes its debut in this issue, with a description of its aims and the proposed page format by Harvey Pough.

The LIFE HISTORY PAGE also is introduced by Harry Greene, who gives instructions to authors and an example.

These additions give HR six special departments: Regional Societies, Geographic Distribution, Caribbean Research, Physiological Miscellanea, Herpetological Husbandry, and Life History. We hope that members and subscribers will let us know what they think of these departments -- and will contribute to them.

More than anything else, though, HR needs NEWS of what members and their societies are doing. It is very difficult to publish a newsletter without any input of news. -- HGD.

MEETINGS AND SOCIETIES

CALENDAR 1972

18-23 June.....AMERICAN SOCIETY OF ICHTHYOLOGISTS AND HERPETOLOGISTS, Annual Meeting, Boston.

26-29 June.....SALAMANDER SYMPOSIUM, Highlands Biological Station, North Carolina. (BY INVITATION ONLY.)

14-17 August...Combined Meeting: HERPETOLOGISTS' LEAGUE and SOCIETY FOR THE STUDY OF AMPHIBIANS and REPTILES, University of Oklahoma Biological Station, Lake Texoma.

11-15 September....INTERNATIONAL SOCIETY ON TOXINOLOGY, General Meeting, Institute of Organic Chemistry, Darmstadt, West Germany.

24-30 September...INTERNATIONAL CONGRESS OF ZOOLOGY, Monaco.

26-28 December....HERPETOLOGISTS' LEAGUE, Annual Meeting (Cosponsored by the SSAR), Washington, D.C. (with AAAS).

CALENDAR 1973

June....AMERICAN SOCIETY OF ICHTHYOLOGISTS AND HERPETOLOGISTS, Annual Meeting, San Jose, Costa Rica.

4-11 August....FIRST INTERNATIONAL CONGRESS OF SYSTEMATIC AND EVOLUTIONARY BIOLOGY, Boulder, Colorado.

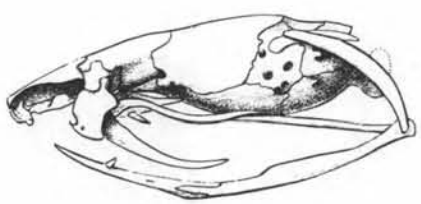
CALENDAR 1974

June....AMERICAN SOCIETY OF ICHTHYOLOGISTS AND HERPETOLOGISTS, Annual Meeting, Ottawa, Canada.

INDIVIDUALS AND INSTITUTIONS

MARY L. ALTALO (Smith Coll., Northampton, MA 01060) received the best student paper award from the HERPETOLOGIST'S LEAGUE, for her paper on, "Repression of egg-eating behavior in brooding females of Desmognathus ochrophaeus," presented at the Annual Meeting in December, 1971.

RENE MARQUEZ M. (Apado. Postal 79-04052, Col. Doctores, Mexico 7, D.F.) is now in charge of the "Programa Nacional de Tortugas Marinas," which is concerned with all aspects of sea turtle conservation.



CARL F. KAUFFELD (Director, Staten Island Zoo, 614 Broadway, Staten Island, NY 11514) will continue the longevity records of captive snakes which previously were done by the late Charles E. Shaw of the San Diego Zoo.

KRAIG K. ADLER (Univ. Notre Dame, Notre Dame, IN 46556) will move to Cornell University in the fall. He joins the section on neurobiology and behavior, where there is a group with common interests in animal orientation.

W. FRANK BLAIR (Univ. Texas, Austin, TX 78712) assumed the presidency of the American Institute of Biological Sciences in January).

SHERMAN & MADGE MINTON (Ind. Univ. Sch. Medicine, Indianapolis, IN 46202) have submitted their manuscript on GIANT REPTILES to Scribner's.

MIKAAL P. BEAUDET (Director, Ocean Res. Lab., Seattle, WA 98105) was bitten on the left index finger by an African Burrowing Viper, Atractaspis bibronii, while examining it on 12 March. (Because of this snake's peculiar jaw mechanism, this happens to everyone who attempts to hold Atractaspis behind the head. BE FOREWARNED! -- HGD.)

CORRIGENDA

In HR 3(6) we carried some collation errors in Current Titles. Our apologies to the readers and to the authors.

The titles by:
Brandner, Robert L.
Cooper, John E.
Grogan, William L. Jr.
Hallinger, Scott
Keefer, Thomas
Metrolis, Albert P.
should read BULL MD HERPETOL SOC.

The titles by:
Carroll, Robert L.
Vaugh, Peter Paul
should read J PALEONTOL.

The title by:
Wake, David B.
should read QUART REV BIOL.

Z O O N O O Z

The American Association of Zoo Keepers is a semi-professional society of animal keepers formed to upgrade their job standards and image. Headquartered in San Diego, CA, the AAZK has members in all of the major zoos of the United States and in many foreign parks. Their Northeast Regional Conference was held in New York, last June.

B O O K R E V I E W

REDDELL, JAMES R. and R. W. MITCHELL (Eds.) 1971. Studies on the Cavernicole Fauna of Mexico. BULL ASSOC MEXICAN CAVE STUD 4: 1-239. (Box 7672 University Station, Austin, Texas 78712. $8.00).

Although mainly concerned with invertebrates, this collection of 14 papers contains checklists of cave-associated faunas which include amphibians and reptiles. From caves of the Sierra de el Abra (Tamaulipas and San Luis Potosi), Reddell and Mitchell list records for the anurans Hylactophryne augusti, Syrrophus cystignathoides, S. dennisi and S. longipes; the snake Bothrops atrox asper; and lizards of the genus Lepidophyma. A second paper by the same authors gives locality data for the urodeles Chiropterotriton chondrostega, C. sp., and C. multidentata, Pseudoeurycea belli and P. scandens; the anurans Eleutherodactylus decoratus, Syrrophus longipes, and Rana pipiens; and the snake Rhadinea crassa in the Sierra de Guatemala of Tamaulipas. A third list, "New Records from Southern Mexico," by Reddell, concerns the practically unknown caves of Chiapas, Guerrero, and Veracruz. Recorded are the anurans Hyla staufferi, Plectrohyla ?sagorum, Eleutherodactylus decoratus, Leptodactylus melanotus, Tomodactylus nitidus, and Bufo marinus.

The black-and-white illustrations include photos of Chiropterotriton multidentata, Pseudoeurycea scandens, and P. belli, all from the file of outstanding photos by Bob Mitchell.

EASTERN SEABOARD HERPETOLOGICAL LEAGUE: E S H L

It is often relatively easy to found new societies, but relatively difficult to amalgamate them once they have been established. Thus, it is a pleasure to report one success.

In previous issues of HERPETOL. REV. we have reported the activities of the East Coast Herpetological Societies which have a total membership of about 800. Most recently, an active correspondence was initiated between the groups by Bob Tuck (MdHS). This correspondence was labelled "SUPPORT HERPS-ACCORD PROJECT 1972" and was aimed at this region's HERPetological Societies ACting in acCORD. The discussion focused on the advisability and feasibility, and the ways and means of further cooperation and/or amalgamation of various regional groups. Officers of the involved societies have debated the pros and cons of amalgamation-cooperation for some months.

On 23 April 1972, officers and representatives of the participating societies met at the home of Mal and Min Skaroff (PHS), and, after some four hours' debate, formed the EASTERN SEABOARD HERPETOLOGICAL LEAGUE - ESHL. In a festive atmosphere, all those present summarized the primary aims and purposes of ESHL as follows:

1) The PHS, NVHA, MdHS, VHS, CtHS (provisionally), and NYHS shall form a League on the basis of equal representation.
2) The main purpose of ESHL will be to coordinate joint and individual projects involving species of amphibians and reptiles whose ranges extend over areas shared by the various societies. These projects include the protection of rare and endangered species and related areas of concern such as the importation of such species.
3) All members of the participating bodies shall have the opportunity to meet twice yearly, in early March and late October.
4) Herps-Accord will continue as a newsletter, but its circulation will be restricted to officers of the constituent societies.

As a HISS representative, I was gratified that the first action of ESHL was to pledge its support of the HISS bibliographic project, in response to H. G. Dowling's editorial in HERPETOL. REV. 4(2). /We wish to thank ESHL for the offer of monetary support, as well./

Robert G. Tuck, Jr., who chaired this meeting, was unanimously elected Coordinator of ESHL and Margaret M. Thomas (NVHA) was elected Secretary.

The formation of ESHL is the culmination of years of consideration and painstaking negotiations. We congratulate all those involved, and trust that the new League will be of great benefit to the entire herpetological community. /IG/

FIRST ROW: Frances A. Velay (PHS), Robert G. Tuck, Jr. (MdHS), Thomas Moore (NVHA), Malvin L. Skaroff (PHS), John Green, Jr. (PHS). SECOND ROW: I. Gilboa (HISS), Harvey Hance (PHS), Theodore Feuerbach (NVHA), Margaret M. Thomas (NVHA), David Hulmes (NYHS), Pat Hulmes (NYHS), Peter Wemple (MdHS), Robert D. Jenning (VHS), Richard C. Gaskill (CtHS), Joseph Couch (PHS). THIRD ROW: Frank T. Watrous, III. (NVHA), Bill Marvel (MdHS).

HERPETOLOGICAL ASSOCIATIONS AND SOCIETIES

Compiled by Itzchak Gilboa

By popular request, we are again listing the active and semi-active herpetological organizations. If there are 5000 herpetologists around the world at present, they are divided into fifty-three groups. In our last list, in HERPETOL REV 2(3):6-9, in September 1970, we included thirty-two groups. Twenty-nine of those are listed here again, and we have added twenty-four new ones. Our sincere apology is hereby extended for any omissions or oversights. Corrections and emendations will, of course, be greatly appreciated.

SUBMITTED MARCH 13, 1972
H. C. SEIBERT, TREASURER

R E P O R T
SSAR BOARD MEETING
DECEMBER 1971

The SSAR Board met from 1:00 - 5:00 P.M. on 29 December 1971 at the Philadelphia Zoological Gardens. The results of the recent election was announced with the successful candidates being:

Chairman-elect.....Arden H. Brame
Secretary.....Max A. Nickerson
Treasurer.....Henri Seibert
Director.....James Vial

The joint SSAR - Herpetologist League meeting (14 - 17 August at the University of Oklahoma - Lake Texoma Field Station) was discussed and Dr. Hutchison was named Meeting Chairman. Dr. Diane Secoy was appointed Publications Secretary. All Standing Committees were approved. The functions and costs of HISS services to SSAR were outlined. The ASIH - Herpetological Catalog has been transferred to SSAR and will be managed by the society. The 1971 and 1972 budgets were approved. 1971 was a good year for SSAR as we will end with a remainder of approximately $4,000. The 1972 budget (exclusive of catalog) is $16,800.

The joint Committee report (Dr. Adler) noted no more money in an amalgamated society than two separate societies. Thus talks on amalgamation may proceed on non-financial matters. Dr. Kennedy presented a thorough Editors Report with numerous suggestions. All Appointed Officers were reappointed.

Max A. Nickerson
Secretary

APPOINTMENTS TO
SSAR MISCELLANEOUS PUBLICATIONS COMMITTEE

I am asking the committee for 1971 to accept reappointment for an additional year, ending 31 December 1972. Additionally, I am appointing two new persons in an effort to diversify the committee and make it more representative of the age distribution in the SSAR. Thus, the committee for 1972 is as follows:

EDITORIAL COMMITTEE:

STEPHEN R. EDWARDS, Museum of Natural History, The University of Kansas, Lawrence, KS 66044, USA

PETER J. KAPLAN, 7 Harwich Road, Providence, RI 02906, USA

ROBERT MERTENS, Forschungsinstitut Senckenberg, Senckenberganlage 25, 6 Frankfurt - M 1, GERMANY

P. E. VANZOLINI, Museu de Zoologia, Universidade de Sao Paulo, Caixa Postal 7172, Sao Paulo, BRASIL

RICHARD D. WORTHINGTON, Department of Biological Sciences, University of Texas at El Paso, El Paso, TX 79902, USA

BOULENGER INDEX EDITOR:

JOHN S. APPLEGARTH, Department of Biology, University of New Mexico, Albuquerque, NM 87106, USA

Kraig Adler, Editor

MEMBERS DESIDERATA

B. H. BRATTSTROM and R. PATTERSON (Dept. Biology, California State College, Fullerton, CA 92631) are working on the recent range of the desert tortoise, Gopherus agassizi. We would appreciate any locality records, sites of road kills, and visual sightings.

WILLIAM H. ZOVICKIAN (1200 Burnham St., Colorado Springs, CO 80906) needs adult female radiated tortoises (c. 12") for attempted breeding with his males. Will purchase or trade for good specimens. Will consider trading a male for a female. Please help.

WILLIAM F. FLANIGAN (Sleep Laboratory, Univ. of Chicago, 5741 S. Drexel Ave., Chicago, IL 60637) would like to purchase immediately several live and very large adult black iguanas (Ctenosaura pectinata).

THE CURRENT STATUS OF THE ENDANGERED SPECIES BUFO EXSUL MYERS DEEP SPRINGS VALLEY, INYO COUNTY, CALIFORNIA

Frederick W. Schuierer

ABSTRACT: The current condition of B. exsul appears good when compared to its adult population size in 1962. Collections made by amateur and professional herpetologists may be or may become its biggest threat. It is recommended to: "Let it be!"

In May 1971 members of the Department of Biology of Cabrillo College visited Deep Springs Valley, Inyo County, California, in order to assess the condition of the exile toads, Bufo exsul Myers. This toad along with a few other ectothermal vertebrates has been placed on the endangered species list by the State of California Resources Agency.

Myers (1942) and Schuierer (1962) discussed the uniqueness of this population of toads, and noted their precarious existence.

MATERIALS AND METHODS

Studies in May consisted primarily of estimating the size of the populations of adults and larvae. The toads are concentrated in the south-western portion of Deep Springs Valley where a series of springs irrigate about two hundred acres of suitable toad habitat. Schuierer (1962-1963), divided the toad habitat into the three zones: the springs, their channels, and marshy areas. The region occupied by toads can be further divided into three subsections in terms of the drainages of the springs. The eastern-most toad area is readily accessible to visitors, and presumably most of the collections have occurred here. The central and western regions are not readily seen, and represent a more undisturbed nucleus of the toad population. The concentration of animals varies from place to place and no one technique for population estimation appeared suitable for use throughout the study. Two methods of enumeration were used to estimate the population size of adults. These were a flush-actual count technique along the pond margins, ditches, and sloughs where toads are easily seen, and an area density estimation in the marshes and bogs. It should be noted that some areas in the central and western part of the toads' range consist of dense mats of vegetation interlaced with swamp-like sedge areas. These boggy sites overlay a semi-soft black anaerobic mud, one to three feet thick.

OBSERVATIONS

Our observations in the Spring of 1971 were made during a continuous spectrum of weather conditions which ranged from snowfall on May 27, 1971 to bright, sunny weather with air temperature of 94 degrees F on May 29th. The toads were active during the entire period of time in about the same numbers. Replicate counts do not vary significantly.

With the exception of two bog areas the counts were made by flushing the animals. The area density figure is considered to be low, as only animals actually seen in the rather soggy bog were used in the figure. It is probable that the population is larger than the count indicates.

Several amplexing pairs were noted, and tadpoles of all sizes were observed in all the areas. In May no transformed young were seen. If the size of toads is considered, it would appear that the eastern-most area has smaller, hence younger, animals. This may reflect the "collecting pressure" in this easily accessible region. The tadpoles are concentrated in the shallow marsh area or in quiet water "pools" bordering the sloughs. Three cubic meters of suitable habitat may contain as many as five thousand larvae. Recruitment of larvae to the adult population appears adequate at this time.

DISCUSSION

Currently the population appears to be stable and maintaining itself. The only difference noted when compared to Schuierer (1962 and 1966), is the large proportion of young adults in the eastern and accessible area, which may reflect collecting. Bufo exsul is a unique and protected species. Unsupervised collecting by any persons or groups, professional or amateur, will have a deleterious effect on the population.

Bufo exsul is well adapted to a rigorous environment. It has adjusted to various climatic conditions and periodic droughts, as well as changes in the irrigation pattern of its habitat. The toad can survive transplantation by students within the confines of the Valley, and even the itinerant observer! It is strongly

TABLE 1. Area Count of Bufo exsul Adults

*Based on area density calculation.

suspected, however, that the black toad cannot withstand the collectors, amateurs or professionals, who harvest numbers of adult toads for any reason. The appeal therefore from a guilty fellow biologist is simply, "Let it be!"

CARIBBEAN RESEARCH PAGE

HAROLD HEATWOLE (Department of Zoology, University of New England, Armidale, N.S.W., Australia) is continuing work on dispersal and species numbers of amphibians and reptiles on several Caribbean Islands (with Richard Levins). Heatwole is also compiling a check-list and key to the amphibians and reptiles of Puerto Rico and the Virgin Islands, and a complete bibliography of the herps of the Puerto Rico-Virgin Island area.

MARGARET STEWART (Department of Biological Sciences, State University of New York at Albany, Albany, New York 12222) would like to hear from anyone working on Jamaican Eleutherodactylus; present, recent past, or future. She is planning field work there soon, and does not wish to overlap studies in progress.

THOMAS A. WIEWANDT (Langmuir Lab., Cornell Univ.) is on Mona Island, Puerto Rico, beginning a year's investigation of the ecology and behavior of West Indian iguanas of the genus Cyclura.

Hemidactylus palaichthus, USNM 192763, TRINIDAD and TOBAGO, Tobago, St John Parish, Little Tobago (= "Bird-of-Paradise") Island; collected 23 July 1971 by Robert G. Tuck, Jr. at approximately 2030 hrs; photographed by Tuck on 24 July.

MORE ON LIZARD HOME RANGES

William W. Milstead

Turner (1971) has criticized a recent article of mine (Milstead, 1971) in which I stated that all that is needed to measure a two-dimensional home range is some graph paper and a pair of scissors, and he has gone on to present a number of theories of home range measurement to demonstrate that such measurements pose problems that are far from simple. I am in general agreement with Turner, but unfortunately, he has missed my point. My statement was made to emphasize that two-dimensional home ranges are more easily measured than three-dimensional ones, and that some attention needs to be given to this difficulty. Regardless of which theory is used in taking the measurements, a two-dimensional home range is very easily measured once the theory is decided upon. If, for example, one is to use one of the polygon methods, all one has to do is to take his measurements in the field, transfer those measurements to graph paper, cut out the home ranges with a pair of scissors, and convert the areas to square meters by weighing them on an analytical balance in comparison with the known area of a square drawn on the same graph paper.

With a three-dimensional home range, on the other hand, there are no simple techniques -- and for that matter, there are no theories, either. Consider, for example, a lizard with a home range that includes two boulders, three fence posts, and a tree. The polygon methods are the only theories that might possibly carry over from two-dimensional home ranges to this situation, and the water-spray technique I suggested (Milstead, 1971) is thus far the only technique available for measuring it. While it was not my intention to make light of two-dimensional home range measurements, particularly of the various theories concerning those measurements, one must conclude that they are far ahead of the virtually untapped frontier of three-dimensional areas.

In the same article, Turner (1971) goes on to question our reasons for measuring home ranges. One reason suggested is that the size of the home range reflects energy expenditure by the animal. Home range studies are also useful in studies of density per unit area, and in studies of lizard spacing within a given area. For these purposes, the recapture radii (Calhoun and Casby, 1958; Jorgensen and Tanner, 1963; Tinkle, 1967 a,b) and ellipse (Jennrich and Turner, 1969) methods may be the best methods to date, but they are probably poor methods for other types of studies.

Home range, particularly when it is associated with territoriality, is a function of social behavior, and as such is very useful to one studying social organization in a population. I am of the opinion that home range sizes are not genetically inherited as display action patterns appear to be. I believe, instead, that they are environmentally determined by several factors including food availability, and both genetically and environmentally determined by the vigor and aggressiveness of the individual. Thus, in any given population, the largest home ranges would be occupied by the dominant lizards, and a lizard's home range size might reflect its position in the community. In this sense, one of the polygon methods or other methods dealing with the actual points where a lizard is recorded may be more useful than theories which tend to depict a home range as a circle or ellipse. The reason being that lines connecting the actual points of sighting or capture may more accurately show the adjacent home ranges (and animals) with which the animal comes in contact. The recapture radii and ellipse methods would not be as useful because they deal with averages and are also based on two very weak assumptions: (1) animal home ranges are circular or elliptical, and (2) all of the area within the circle or ellipse is suitable for occupancy by the animal. Neither of these is true for animals that live on trees or boulders and they are probably true only rarely for animals living on plane surfaces.

My personal preference is for the minimum polygon methods because of these two reasons and also because a minimum polygon may be all the land that a male of a strongly territorial species can hold. Turner and others have suggested that home ranges tend to continue increasing in size with additional captures, but there is considerable evidence that the ranges actually show a decrease in size as main activity areas become identified. In fact, it has been suggested (Milstead, 1961) that the entire day-to-day activity area of an animal be termed the "home realm," and that the term "home range" be restricted to the smaller area of "usual" activity. Tinkle (1967b) effectively reached the same conclusion, although he applied the term "home range" to the larger area which I called the "home realm".

It should be noted that division of a lizard's activity area into home range and home realm requires a number of observations (recaptures). In my 1961 paper, I attempted to map the two areas for lizards with five or more captures, but was not successful with any except one for which I had 22 observations.

I am grateful to Dr. Donald W. Tinkle for critically reading the manuscript.

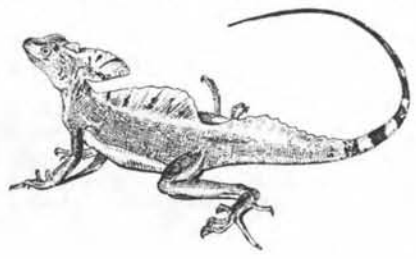
LIFE HISTORY PAGE

Many people who collect and study reptiles and amphibians accumulate notes on reproduction, natural food items, etc. which are not suitable for conventional publication. The LIFE HISTORY PAGE is a place for short but noteworthy reports on such topics. The rationale for it is that if this type of information is more readily available it can be of use to others working on comprehensive studies of a particular topic or species.

Information for Contributors



List significant data in concise but complete sentences or in a table when appropriate. Include such things as source and size of females, pertinent dates, duration and conditions of incubation, and number and size of eggs and young. Indicate the location of preserved specimens, and use abbreviations when they are in the author's institution or private collection. Use literature citations and brief comments when necessary to emphasize noteworthy aspects of the data. H. S. Fitch's recent review (1970, Reproductive cycles in lizards and snakes, MISC PUBL UNIV KANSAS MUS NATUR HIST 52) or other relevant summaries will be used in evaluating manuscripts, and they may also be sent to one or more reviewers. Authors will be given an opportunity to approve any necessary changes. -- HWG.

SAURIA

BASILISCUS BASILISCUS. A nest was found on top of an exposed bluff approximately 30 m above the Rio Puerto Nuevo, 13.7 mi NE Palmar Norte, COSTA RICA, 13 June 1971. Five eggs were under a rock about 20 cm in diameter, in a small burrow 3 cm below the surface. An Ameiva quadrilineatus was in the same burrow. Four eggs hatched 3 November 1971. Measurements at hatching were (snout-vent length, mm; tail length, mm; weight, g): 41, 82, 1.7; 38, 74, 1.3; 39, 75, 1.4; 38, 76, 1.6. Two are catalogued as UTA R-3520 and R-3521. -- JERRY R. GLIDEWELL, Department of Biology, UNIVERSITY OF TEXAS AT ARLINGTON, Arlington, Texas 76010.

OBSERVATIONS ON THE BURROWING HABITS OF THE TIGER SALAMANDER (AMBYSTOMA TIGRINUM)

Edward R. Gruberg and R. Victoria Stirling

We placed several adult tiger salamanders in a 5' x 10' outside enclosure near our laboratory at M.I.T. They spontaneously and unanimously dug burrows into which they entered within a few hours. What follows is a description of salamander burrowing that we observed over the course of two years.

The enclosure had a one-and-one-half foot hill on the north side, and on the south side was a 2' x 3' x 6" deep pond filled with running tap water sufficient to maintain a more or less constant level.

All animals were placed in the enclosure during the day. Some were put in the pond, and others were placed on land. They followed idiosyncratic initial courses. Some made a movement in a particular direction, then started to make complete burrows (described below). Others circumnavigated the enclosure several times, making a few feeble initial attempts at burrowing at different spots. Others moved in and out of the pond a few times over two to three hours before burrowing.

The actual burrowing is stereotyped. The animal finds a suitable spot, often with an overhanging branch or stone. One forelimb digs, using quick backward thrusts and short recovering strokes. During digging, soil is often thrown into the air. The opposite forelimb may take over after 3 to 10 cycles; this changeover is sometimes accompanied by a reversal of the hind limb positions (similar to that observed in freely walking salamanders). When sufficient soil is piled up around the animal's trunk, the forelimbs often stop digging, and the hind limbs plow the soil backwards. They are alternately swung forward and powerfully retracted. During the forelimb digging, the position of the animal's body does not change much. When the forelimbs and hindlimbs change over, the body is thrown into a flexed position, and the nose pushes laterally at the sides of the burrow. The head movement does not occur during hindlimb plowing. Thus, slow but steady progress is made, and with pauses of from a few seconds to half a minute the salamander burrows, completely covering itself in 10 to 20 minutes. If the burrow is uncovered 20 minutes to an hour after the animal disappears, it has curled itself around, facing the direction of entrance to the burrow. During excavation the animal covers up the entrance with loose soil. Indeed, only a tell-tale tail trail, where the tail has slid along the loose soil, is left as evidence.

Two or three days later the salamander will open an entrance to the burrow and will be poised with its head at surface level. It will retreat an inch or so if an initial rapid movement toward the hole is made by an investigator. It can be lured partially out of the hole by an insect or small toad, but it will not come out beyond its hind legs. The animal sits with its head at the surface night and day despite direct sunlight and temperatures up to 93 degrees F. On several occasions an animal left its burrow during and after heavy night-time rain. The next day the burrow entrance was gone, but the trail of the tail could be seen. Two or three days later, within a few inches of the original burrow entrance, the animal had opened another entrance and was facing out once more. On several occasions over a month's period, one animal was found curiously arranged, facing into its burrow with only its tail exposed. A live cricket touching its tail induced it to turn around and catch it.

One side of the hill was faced with plexiglas along which several burrows were made by the investigators. Salamanders, finding these burrows, would proceed into them and, in an hour or so, turn around to face the entrance. They would disappear from these burrows in 1 to 2 days and would not return to them again.

These observations show that tiger salamanders can burrow. The sequence of limb movements and the position of the head sharply identify burrowing as distinguished from walking. In burrowing there are independent non-alternate diggings by forelegs, while the hindlegs are moved alternately in a plowing movement often unsynchronized with the forelegs. The head is bent, pressing down into the soil. In walking the head is erect, and the legs are moved in typical sinusoidal quadrupedal gait (Gray and Lissman 1940).

Whether tiger salamanders under natural conditions dig their own burrows is still open to question. They will enter a prepared hole, but we believe that, at least on occasion, it must be more efficacious to dig their own.

Tiger salamanders and their relatives have been assumed to be burrowing animals. Pike (1886) dug out marbled salamanders three feet down below soft ground. Hamilton (1946) located a subspecies of tiger salamander in burrows containing rodents, which he thought had made the burrow. A spotted salamander was found at the mouth of a tunnel that she may or may not have excavated (Gordon 1968). The commonly found plethodontid salamanders have been more extensively observed than tiger salamanders, possibly because they live close to the surface. They are far less muscular than tiger salamanders, and although they have been observed sitting at the mouth of burrows (Huheey 1964, Valentine 1964), they do not seem to actively dig them. They can, however, wedge out burrows using cracks and crevices in the substrate (Gordon 1952, Heatwole 1960, Brandon 1965). Siren and Amphiuma have also been observed in burrows under adverse, dry conditions (Knepton, Jr. 1954, Freeman 1958).

ACKNOWLEDGMENT

We would like to thank George Petievich of the M.I.T. Physical Plant for providing outside space to set up our enclosure, Michael Sporer for aid in constructing the enclosure, John Barrett and Harold Edgerton for the use of a movie camera and projector, and Dr. C. Robert Shoop for many suggestions concerning the text.

This work was supported in part by a grant from Bell Telephone Laboratories, Inc., in part by the National Institutes of Health (Grant 5 PO1 GM14940-05), and in part by NGMS (Grant 5 PO1 GM1555-05).

COMMENTS ON THE TYPE OF *ENGYSTOMA MEXICANUM* PETERS, A JUNIOR SYNONYM OF *GASTROPHRYNE USTA* (COPE)

Craig E. Nelson

Peters (1870) described *Engystoma mexicanum* from "the warmer parts of Mexico (Matamoros and other sites)" in a paper "on Mexican amphibians" sent by "Mr. Berkenbush in Publea." No other information on geographic origin was given and no type was cited. The description was quite short "In form and color very similar to *E. carolinensis*, but with two salient tubercles on the heels, of which the inner is the largest, with salient tubercles under the fingers and toes and with markedly shorter fingers and toes. Total length 0.026 m., head length 0.008 m., head breadth 0.009 m., front limb 0.013 m., hand 0.015 m., third finger 0.003 m., hind limb 0.031 m., foot 0.016 m., fourth finger 0.006 m." (my translation of entire description except for a footnote dealing only with other genera).

Cope (1871) and subsequent workers have consistently considered *E. mexicanum* a junior synonym of *E. ustum* Cope (1866) which is now placed in *Gastrophryne* (Carvalho, 1954; Nelson, 1972b). Two metatarsal tubercles as cited by Peters are found in *G. usta* and in no other *Gastrophryne* but with the original description one cannot separate *E. mexicanum* from *Hypopachus*, the only other Mexican microhylid genus.

The records of the Zoological Museum of Humbolt University of Berlin indicate that their number 6667 (Figs. 1-3) from "Mexico" is the type of *E. mexicanum* Peters. Through the courtesy of Dr. Gunther Peters, I have examined this specimen. Its features match those in the type description. It has two transverse pharyngeal folds and a firmisternal girdle and is therefore a microhylid. It differs from *Hypopachus* in lacking digital webbing. The specimen is the leathery brown color characteristic of frogs which have been preserved for decades and no markings are evident. However, the presence of two metatarsal tubercles and the absence of hindfoot webbing are sufficient to distinguish the specimen from all North American microhylids except *G. usta*.

Taylor and Smith (1950) restricted the type locality of *E. mexicanum* to (Izucar de) Matamoros, Puebla. There are no other records of *G. usta* from Puebla, nor any valid records from other inland areas (Nelson, 1972a). The restricted type locality therefore seems inappropriate.

NOTEWORTHY ARIZONA HERPETOFAUNAL RECORDS

Donald E. Hahn and Clayton J. May

The herpetofauna of southern Arizona has received a great deal of attention in the past decade, and the ranges of most species in this area are fairly well known. Portions of the northern part of the state have also been extensively studied, especially the Grand Canyon area. The distribution of most species of reptiles and amphibians in the vast area of central Arizona is by contrast poorly known.

Over the past few years a number of specimens, some of which represent significant distributional records, have been taken or examined by us, primarily in central Arizona, and are here listed. We wish to thank the following people for allowing us to report on specimens in their care: J. Fouquette, Arizona State University (ASU); S. W. Carotheres, Museum of Northern Arizona (MNA); R. S. Funk, Southern Illinois University, Edwardsville (RSF); and S. F. Hale, Tucson, (SFH). We would also express our appreciation to Dr. Larry D. Wilson for reading the manuscript and offering many valuable suggestions. DEH and CJM numbers represent specimens in our personal collections.

Unless otherwise noted, all range extensions are based on the distribution maps given by Stebbins (1966).

Ambystoma tigrinum - Yavapai Co., 2 mi. NNE Hillside, DEH 3983. This specimen extends the known range of this species slightly to the southwest in Arizona and into the Lower Sonoran Life Zone.

Bufo alvarius - Yavapai Co., 5.0 mi. NW Hillside, DEH 5002; 1.1 mi. NW Hillside, DEH 5001. These records are approximately 20 miles WNW of the nearest published localities: 31 and 16 mi. NW jct. Arizona Hwy. 71 and U. S. Hwy. 93 (Fouquette, 1970).

Bufo cognatus - Coconino Co., 4 mi. E Wupatki Nat'l. Mon. boundary (U. S. Hwy. 89) on Forest Rt. 545, CJM 175. This specimen significantly extends the known range of this toad southward in northern Arizona.

Gastrophryne olivacea - Santa Cruz Co., Pajarito Mts., 9 mi. W jct. Arizona Hwys. 93 and 289 (Ruby Rd.) CJM 1190. This specimen is an adult female albino and represents the first record of albinism in this species. In life the specimen had a dorsal pattern like that of normal frogs of the area except that the yellow-brown blotches formed broken lateral lines converging just behind the head. The iris was pink.

Captive frogs from the same chorus deposited an abundance of eggs, yet the albino failed to reproduce after three days in amplexus. Gross examination of the ovaries revealed most ova were darkly pigmented and small in comparison with those from normal-colored females in the same population.

Trionyx spinifera - Yavapai Co., Cottonwood, DEH 5900; jct. Oak Creek and Verde River, DEH 5240. These specimens extend the known range of this introduced species approximately 100 miles northward into central Arizona.

Sceloporus clarki - Gila Co., 1.5 mi. S Pine, DEH 4584; Coconino Co., Sedona, DEH 5723; Yavapai Co., 13.5 mi. N Cottonwood; numerous other localities throughout the Verde Valley in Yavapai Co. These records extend the known range considerably to the north and northeast.

Cnemidophorus inornatus - Coconino Co., 2.1 mi. S Interstate Hwy. 40 on Meteor Crater Rd., MNA 27-314 through 320, DEH 5907. Lowe, et al (1966) mentioned this relictual population in the Colorado River Basin but did not give any specific locality data. Field work by the junior author has shown this population to be restricted to the grasslands and the peripheral disclimax grasslands along the north and east edges of the San Franciscan volcanic field. Variation and taxonomic status of this population will be presented elsewhere.

Heloderma suspectum - Yavapai Co., Page Springs; 11 mi. N Cordes Junction. These specimens were examined and released, and confirm the provinence of the old Verde Valley record from Fort Verde (Bogert and Del Campo, 1956). Dr. H. S. Colton of the Museum of Northern Arizona has also examined a gila monster from Clear Creek, Yavapai Co.

Leptotyphlops humilis - Yavapai Co., Cottonwood, DEH 5375, 5748, 5834; 6.5 mi. SSE Cottonwood, DEH 5009; 3 mi. W Sedona, DEH 5173. These records extend the known range of this snake 40 miles northward and northwestward in central Arizona. The nearest published locality is 1 mi. W Childs, Yavapai Co. (Hulse, 1971).

Lichanura trivirgata - Mohave Co., 10.2 mi. NW Santa Maria River on U. S. Hwy. 93, ASU 13629; Yavapai Co., 2.1 mi. SE Yavapai-Mohave Co. line on U. S. Hwy. 93, CJM 950. These specimens extend the known range of this species northward 40 miles from the nearest published record of Aguila, Maricopa Co. (Lowe, 1964).

Chilomeniscus cinctus - Maricopa Co., Fort McDowell, DEH 3876. This is a northern peripheral record for this uncommon species.

Elaphe triaspis - Pima Co., Empire Mts., Lead Mt., Chief Mine, DEH 3694. This specimen represents the first record for this species in the Empire Mts., which extends the known range of this species slightly northeastward in Arizona. Previously this snake was known from only four mountain ranges within Arizona: the

Baboquivari, Pararito, Santa Rita, and Chiricahuas.

Lampropeltis getulus - Coconino Co., 1.1 mi. W Coconino-Navajo Co. line on U. S. Hwy. 66, RSF 3393; 3.7 mi. W Sunrise Trading Post on Indian Hwy. 15, MNA 27-431. These records significantly extend the known range of this species eastward in northern Arizona.

Phyllorhynchus decurtatus - Yavapai Co., 14 mi WNW Hillside, DEH 3975; Mohave Co., 16.2 mi. SE Wikieup, DEH 3974. These localities extend the known range of this species 30 miles NNW and 50 miles NW respectively from the nearest published locality, 2.5 mi. N Congress Junction, Yavapai Co. (Fowlie, 1965).

Masticophis bilineatus - Yavapai Co., 8.9 mi. ESE Camp Verde, DEH 5920. This specimen represents a significant range extension northward.

Masticophis flagellum - Yavapai Co., Clarkdale, DEH 3956, 5096, 6480; Cottonwood, DEH 5527, 5546; 9 mi. NE Cottonwood, DEH 5215. This is a fairly common snake in the Verde Valley. Wilson (1970) did not examine any specimens from this far north in central Arizona.

Salvadora hexalepis - Conconino Co., Wupatki Nat'l. Mon., 20 mi. E U. S. Hwy. 89 on Forest Route 545, SFH 2064. This specimen represents a southward range extension in northern Arizona and the first locality south of the Little Colorado River. These new distribution records of Bufo cognatus, Lampropeltis getulus, and this species seem to coincide with the Great Basin Desert and adjacent grasslands of the Colorado River drainage basin in northern Arizona.

Tantilla planiceps - Yavapai Co., Cottonwood, DEH 5690; Bell Rock, 5.3 mi. S Sedona, DEH 5729; 8 mi. NW Santa Maria River on U. S. Hwy. 93, ASU 13203. The first two records extend the known range of this species approximately 100 miles northward from the nearest published locality of Phoenix (Tanner, 1966). The last specimen helps bridge the gap in the ranges of T. p. atriceps and T. p. utahensis, and is 27 mi. NW of Date Creek, Yavapai Co., the nearest locality from which this species was previously known (Tanner, 1966).

Trimorphodon biscutatus - Coconino Co., Sedona, DEH 5722. This specimen extends the known range of this species approximately 50 miles NNE of the nearest published record, 5.4 mi. S jct. 79 and 69 on 69 (Black Canyon), Fowlie, 1965.

Micruroides euryxanthus - Yavapai Co., Bridgeport, DEH 5376; jct. Oak Creek and Verde River, MNA 27-491. Both specimens were taken while crawling about on the surface during the day. These records extend the known range of this species approximately 45 mi. ENE from the nearest published locality, Fort Whipple, Yavapai Co. (Fowlie, 1965).

Crotalus scutulatus - Yavapai Co., Cottonwood, DEH 5390; 5 mi. SSE Cottonwood, DEH 5828; Clarkdale, DEH 3570. These specimens extend the known range approximately 35 miles ENE of the nearest records, Drake and Prescott, Yavapai Co. (Klauber, 1930).

GEOGRAPHIC DISTRIBUTION

HERPETOLOGICAL REVIEW will publish brief notices of new geographic records, in order to make these available to workers in published form. The STANDARD FORMAT for these records is:

SCIENTIFIC NAME. Locality /air-line distance and direction from a town/; Date; Collector. Identified or verified by. Place of deposition and catalogue number. Comments. SUBMITTED BY, and address.

Please submit new locality records to: GEORGE R. ZUG, Division of Reptiles & Amphibians, National Museum of Natural History, Washington, DC 20560.

N E W R E C O R D S

AMBYSTOMA TEXANUM. U.S.A., Alabama, Baldwin Co., Mobile Delta, approx. 5 air mi. W. of Stockton on Mound Is.; 9 May 1970; A. Floyd Scott & R. M. Johnson. Verified by Robert H. Mount & George W. Folkerts. Univ. S. Alabama Herpetological Collection 1756-1772. First records for lower Coastal Plain of Alabama. Submitted by A. Floyd Scott & R. M. Johnson, Dept. of Biol. Sci., Univ. S. Alabama, Mobile, Alabama 36608.

EUMECES ANTHRACINUS ANTHRACINUS. Ohio, Vinton Co., Brown Township, Section 17, near junction of Long Ridge and Furnace Roads; 12 July 1970; W. D. Parker. W. D. Parker & G. R. Zug. The first record for Ohio. National Museum Natural History, USNM 193801. Submitted by W. D. PARKER, Big Cypress Center, P.O. Box 1408, Naples, FL 33940.

GRAPTEMYS GEOGRAPHICA. Louisiana, Ouachita Parish, ca. 8 mi. N of Monroe, Ouachita River near Walls Lake; 14 March 1963; N. H. Douglas. N. H. Douglas. Northeast Louisiana University, NLU 622. First record for Louisiana. Submitted by N. H. DOUGLAS, Department of Biology, Northeast Louisiana University, Monroe, LA 71201.

HEMIDACTYLUS PALAICHTHUS. Tobago, St. John Parish, Little Tobago (= "Bird-of-Paradise") Island; 23 July 1971; R. G. Tuck, Jr. R. G. Tuck, Jr. National Museum of Natural History, USNM 192763-65. First record for Tobago; Florida State Museum, UF/FSM 26252-55 are this species but were reported to be H. mabouia by Dinsmore (Quart. J. Florida Acad. Sci. 32(4)1969:408. Submitted by R. G. TUCK, Jr., Division of Reptiles & Amphibians, National Museum of Natural History, Washington, DC 20560.

PHYSIOLOGICAL MISCELLANEA

Instructions for Contributors

The aim of this Department is to provide a vehicle for publication of isolated physiological measurements of amphibians and reptiles. It can place in the literature data which, while they are fully rigorous and valid, are too scanty to warrant the usual sort of publication. What we have in mind are such things as field data gathered during trips to foreign countries or measurements made on a rare animal in the laboratory -- in general, any situation in which useful data have been gathered and there is no likely prospect of further measurements being possible. The Department is not intended for publication of data too shaky to be accepted elsewhere, or for quick publication of preliminary results in an attempt to establish priority.

For the data reported here to be useful, it is essential that the techniques used to gather them be rigorous. This is particularly true because we propose to publish data involving fewer replications than usual. On the other hand, publication is expensive and brevity is necessary. Authors should prepare their manuscripts in a 44-space line in the following format:

TITLE (Include species of animal and type of measurement - e.g. "Body temperatures of Bothrops atrox in the Field," not "Physiological Observations of Snakes.")

METHODS (Make this section as brief as is possible without sacrificing clarity. Refer to previously published descriptions of techniques when possible.)

RESULTS (These may be entirely in tabular form if it saves space.)

DISCUSSION (Only if absolutely necessary; in most cases it won't be.)

LITERATURE CITED (Since most papers will have neither an introduction nor discussion, few will cite any literature.)

AUTHOR (Full name and address.)

Because it is essential to maintain a high level of rigor, all manuscripts will be sent to referees who will be asked to evaluate (1) the value of the data presented, and (2) whether the contribution adheres to the standards outlined above. Manuscripts may be edited to improve clarity or brevity; edited manuscripts will be returned for author's approval.

CURRENT HERPETOLOGICAL TITLES, XX: 1971 - 1972

Herpetological Information Search Systems
American Museum of Natural History
New York, New York 10024

We have brought to your attention more than 16,000 current titles in the pages of this journal to date.

The titles of papers appearing in our lists were obtained by regular scanning of about 2500 journals directly and more than 1000 through secondary sources such as Chemical Abstracts Biochemical sections, Current Contents, publishers' catalogs, etc. Theses in English also appear, coming from such sources as Dissertation Abstracts and various academic publications. Abstracts of papers presented at various meetings and symposia are included. A complete list of the journals covered by us is published in Herpetol. Yearb. 1971. The coverage of books and theses in languages other than English is improving because a larger number of our colleagues bring those titles to our attention. Some copies have been mailed directly to us for inclusion in our lists. However, we would still appreciate being made aware of new books, reports, and non-English theses.

We realize that many of the titles listed are marginal to the field of herpetology as customarily defined. Many are published in journals of physiology, pharmacology, cytology, or embryology. Others are from medical journals, state fish and game publications, or pet animal journals. Thus, they are not aimed at an audience of herpetologists. All of them, however, deal in some way with amphibians and reptiles. As such, they may be of interest to at least some readers of HERPETOLOGICAL REVIEW. It seems better to let the reader make the selection from the list, rather than one of our small group deciding that this paper or that -- or this kind of paper -- is of no interest to anyone.

Our present policy, then, is to list the title of any current paper (e.g., 1971-1972) that is concerned with a member of a Recent order of amphibians or reptiles.

HERPETOLOGICAL REVIEW has appeared bimonthly, beginning in 1971. This means that the titles published here will be more current than the previous quarterly issues allowed.

Except for the omission of extinct orders, our list is comparable with that of the Amphibia and Reptilia sections of the Zoological Record, though ours is more comprehensive and considerably more current.

This list contains titles of books and articles that have come to our attention during the period 16 Jan. 1972 through 1 April 1972. HR is computer printed and because of necessary production procedures there is a possibility that on occasion the titles from a single issue of a journal may appear in several issues of HR. Periodical title abbreviations follow the International List of Periodical Title Word Abbreviations (based on the Amer. Nat. Standards Comm. Z39.) (Chemical Abstracts Service, Columbus, Ohio, US.).

Acknowledgements. This list was prepared by the HISS staff: H. G. Dowling, I. Gilboa, I. Palser, and M. Coxe. J. A. Peters of the U. S. National Museum has continued to provide a welcome back-up program to our search of the literature, and G. J. Jacobs of NASA has kept us informed of the many publications and translations resulting from the United States space efforts. The library staff of the Museum have continued to aid our project. Special thanks to the members of the Herpetology Department, AMNH for their aid in cross indexing, which allows us to offer new services. We continue to rely on the advice and aid of James E. Bradley of the University of Rhode Island Computer Laboratory. We also wish to thank the many individuals who have sent us early copies of reprints for inclusion here.

This is contribution Number 38 of the Genera of Reptiles Project, which is supported by the Information Services Program of the National Science Foundation (NSF GN-707).

*H*ERPETOLOGICAL
*I*NFORMATION
*S*EARCH
*S*YSTEMS

HISS proposes to continue publication of "Current Herpetological Titles" after the present supporting NSF grant expires in December. However, neither the SSAR nor the Herpetologists' League (and perhaps no unified society) can fully support this portion of the HISS program, which is basic to its other operations. It probably will be necessary, therefore, for HISS to charge individual subscriptions of $10 or $15 in order to continue this service (see the description of coverage in the introductory section on this page).

WE have never assumed that herpetologists or their societies would pay more than a portion of HISS's $100,000 annual budget, but they must give substantial indication of their interest for it to seem worthwhile for us to seek the outside funds necessary for continuing.

WE anticipate that HISS services and publications might produce one-quarter of the budget in 1972, and perhaps one-half of it in 1973. In order to achieve these financial goals, however, we must have more subscriptions to our publications and services, as well as donations of funds from institutions and individuals.

Therefore, we encourage all who feel that the HISS operation should continue to support it both by letter (to HGD) and by subscription to at least one of its several publications and services (see page 120).

H. G. Dowling
HISS Director

CURRENT HERPETOLOGICAL TITLES

Because of NSF support, HISS has been able to produce twenty lists of titles since 1968 which were "free" to members of the SSAR and the H L. Reduced support will result in a deficit in 1972, however, and it seems likely that these productions cannot continue in 1973 without substantial support from individuals. We ask that you indicate your support now. Subscription costs will be based on the number of potential subscribers.

To HISS:
I wish to continue receiving "Current Herpetological Titles" in 1973, and am willing to pay a subscription of $10.00 to aid in its continued production.
[Please do not pay 1973 subscriptions now. We will bill you.]

Further, I enclose a check for $10.00 to give substantial indication of my support of this project, and to help reduce the deficit anticipated in 1972.
[Make check to "AMNH: Herpetol. Title"]

SIGNED A. G. Miller
[No address necessary if your name is on the SSAR or HL mailing list.]

Sent Sept. 4

SPECIAL SERVICES

HISS attempts to provide taxonomic data to those who need it. This includes the location of type specimens, copies of original descriptions, and original drawings of features that have taxonomic importance (e.g., hemipenes, skulls, vertebrae).

We also have an "Area Alerting Service," which will give workers quarterly notice of papers that have appeared in his special field of interest (see HR 3(5): T71). Costs are as follows.

Original Description..... $3.00
Original Drawing (one-time use).....$15.00
Area Alerting Service.....$25.00

YEARBOOK OF HERPETOLOGY

For 1971*.....	15	12
For 1972.....	20	10

*Problems of compilation have delayed publication of this first issue. It will appear soon.

LIBRARY CARDS

Some 3,000 to 4,000 titles of articles on herpetological subjects are printed on Library of Congress stock each year (see HR 3(5): T71).

Deck 1 (about 1/3 with abstracts	$250	$150
Decks 2-4 (each).....	200	100

SOCIETY FOR THE STUDY OF AMPHIBIANS AND REPTILES

Membership is open to anyone who is interested in amphibians and reptiles.

Members have voting privileges in the Society. They receive the JOURNAL OF HERPETOLOGY (2-3 issues/year), HERPETOLOGICAL REVIEW (6 issues/year), and FACSIMILE REPRINTS IN HERPETOLOGY (2-3 issues/year). They may purchase other Society publications at reduced rates.

Regular Member:
U.S. & Canada.....$8.00
Other Countries.....$6.00

Sustaining Member.....$10.00

Contributing Member.....$15.00

INSTITUTIONAL SUBSCRIPTION to "SSAR Package" (J HERPETOL, HERPETOL REV, FASC REPR)...$16.00

Write: HENRI C. SEIBERT
Treasurer, SSAR
Department of Zoology
Ohio University
Athens, OH 45701 USA

CATALOGUE OF AMERICAN AMPHIBIANS AND REPTILES
(Now published by the SSAR)

A loose-leaf series of 2- to 4-page species accounts of the amphibians and reptiles of the Americas, with special emphasis on those in the United States and Canada. Accounts 1-125 were published from 1963 to 1971.

Binder, Taxonomic Tabs, and Accounts 1-125.

Individuals..... $22.00
INSTITUTIONS..... $27.00

Subscription for 1972

(Accounts 126-150)

Individuals..... $ 5.00
INSTITUTIONS..... $ 7.00

HERPETOLOGISTS' LEAGUE

All persons interested in herpetology are eligible for membership.

Members receive HERPETOLOGICA (4 issues/year) and HERPETOLOGICAL REVIEW (6 issues/year). They may submit manuscripts for publication in both these journals, and may present papers at the League's Annual Meeting.

HERPETOLOGICA has been published regularly since 1936. All back issues are available.

Member..... $8.00

Fellow (elected).....$10.00

INSTITUTIONAL SUBSCRIPTION to HERPETOLOGICA.....$15.00

Write: HOBART E. LANDRETH
Secretary-Treasurer, H L
R. R. #1, Box 478
Oklahoma City, OK 73111

ADVICE TO AUTHORS

HERPETOLOGICAL REVIEW publishes feature articles that pertain to amphibians and reptiles, the people who study them, and the relevant societies and institutions. It is not intended as an outlet for reporting the results of research on these animals. Articles describing (and/or photographs illustrating) rarities, expeditions, laboratories, societies, museums, and historical articles that pertain to herpetological study are especially welcome.

FORMAT. Manuscripts should be type-written on white bond paper, one side only. All material, including legends for figures and literature cited, is to be double-spaced. Scientific names of genera and species are underlined. Titles should indicate clearly the subject and the animal group(s) included. Use standard abbreviations for journals.

The 1971 YEARBOOK OF HERPETOLOGY (published by HISS) contains a list of American Standard abbreviations for some 2,500 journals. Other publications that will be of assistance in the preparation of manuscripts are:

CATALOGUE OF AMERICAN AMPHIBIANS AND REPTILES (see information on this page).

Common names for North American amphibians and reptiles (COPEIA 1956(3): 172-185).

SCIENTIFIC WRITING FOR GRADUATE STUDENTS, by F. Peter Woodford (Rockefeller Univ. Press, New York, NY 10021). $5.75.

STYLE MANUAL FOR BIOLOGICAL JOURNALS (American Institute of Biological Sciences, 3900 Wisconsin Avenue, NW, Washington, DC 20016). $3.00.

A publication that will be found helpful in planning and producing adequate illustrations is:

A HANDBOOK OF BIOLOGICAL ILLUSTRATION, by Frances W. Zweifel (University of Chicago Press, 58th Street at Ellis Avenue, Chicago, IL 60637).

Line-cuts are photo-offset directly with the text, and should have widths of 4 1/4 inches (one column) or 9 1/4 inches (two columns). Each line of illustration equals six lines of text (full page copy length is 12 3/4 inches). Line cuts are reduced about 25 per cent in processing.

Photographs and drawings reproduced by half-tone plates are handled separately but should be planned for one-column or two-column reproduction.

PAGE CHARGES AND REPRINTS

Authors of articles or reports submitted to H R are asked to contribute toward their publication costs to the extent of $20 per page. This payment is not a prerequisite to publication. However, paid articles receive priority and are likely to appear earlier than others.

Page-charge payments entitle the author to 100 reprints (or tear-sheets) without additional charge. [Additional reprints may be purchased at $5/page/per 100 copies.]

Cost-sharing of this kind allows additional publication without increasing H R's cost to Society members and subscribers. It is, thus, a method of holding dues and subscription rates at their present levels.

THE NEWSLETTER ON AMPHIBIANS AND REPTILES...
AND THE PEOPLE WHO STUDY THEM

VOLUME 4, NUMBER 2
APRIL 1972

SOCIETY FOR THE STUDY OF AMPHIBIANS AND REPTILES

The Society was founded in 1958 as the OHIO HERPETOLOGICAL SOCIETY. Following rapid growth of membership and expansion of operations, the organization became the SOCIETY FOR THE STUDY OF AMPHIBIANS AND REPTILES in 1967.

The SSAR encourages the acquisition of knowledge on amphibians and reptiles, and the dissemination of scientific information of these animals. It encourages the conservation of wildlife in general, and of amphibians and reptiles in particular. A major effort is made to achieve closer cooperation and effective communication between amateur and professional workers. (See Third Cover for membership information.)

HERPETOLOGISTS

LEAGUE

The Herpetologists' League is an international organization which was established in 1936 by Major Chapman Grant. It is dedicated to furthering knowledge of the biology of amphibians and reptiles.

In 1971 it had 900 members and fellows (including Life and Honorary members), and more than 400 institutional subscriptions to its journal, HERPETOLOGICA, which has been published continuously since 1936.

All persons interested in herpetology are eligible for membership. (See Third Cover for membership information.)

THE LAKE TEXOMA MEETING: August 15-17, 1972

The University of Oklahoma Biological Station will be the site for the fifteenth annual meeting of the Society for the Study of Amphibians and Reptiles, held jointly with the Herpetologists League.

University of Oklahoma Biological Station, Lake Texoma, in south-central Oklahoma is a permanent field station designed and operated to offer opportunities for study and research in ecology and natural history and those phases of taxonomy, evolution, morphology, and physiology that require extensive study of organisms in their natural habitats. The Biological Station is an instructional and research unit of the University of Oklahoma and subject to the general rules and regulations thereof. It is situated on the north shore of the Red River arm of Lake Texoma at the mouth of Buncombe Creek, two miles east of Willis, and 18 miles south of Madill, Marshall County, Oklahoma.

Lake Texoma is an impoundment of the Red and Washita rivers, formed by the Denison Dam, built by the U.S. Army Engineer Corps at Denison, Texas. The gates of the dam were first closed in July, 1942, and the reservoir was filled to power-pool level (617 feet above sea level) by 1945. The lake at power-pool level has a surface area of 93,000 acres, a capacity of 5,715,700 acre feet, and a shoreline of approximately 700 miles. Its drainage basin occupies 38,291 square miles. The Red River

separates the states of Oklahoma and Texas; therefore, the lake is bounded by both states.

The biotic province in which Lake Texoma and the surrounding region are located is characterized by tall grass prairies and blackjack-post oak forests. Bottom land and flood plain vegetation are found along many of the tributary streams. Low limestone hills covered with sand, clay, loam, or a mixture of these, often with extensive stone outcrops, are abundant as are plains and valleys with similar soil types. Cultivated fields of various crops, eroded areas in beginning to advanced states, permanent and intermittent streams, farm ponds, and marginal wet lands all abound in the vicinity.

The location of the Biological Station -- on a man-made lake in an area with a variety of both aquatic and terrestrial environments where there has been little biological investigation -- greatly enhances the opportunities for research in both botany and zoology. The biology of such reservoirs as Lake Texoma is but slightly known; the number of these reservoirs is increasing. The need for a knowledge of their biology is consequently all the greater. Since Lake Texoma, primarily for flood control, is also used for electric power production, the

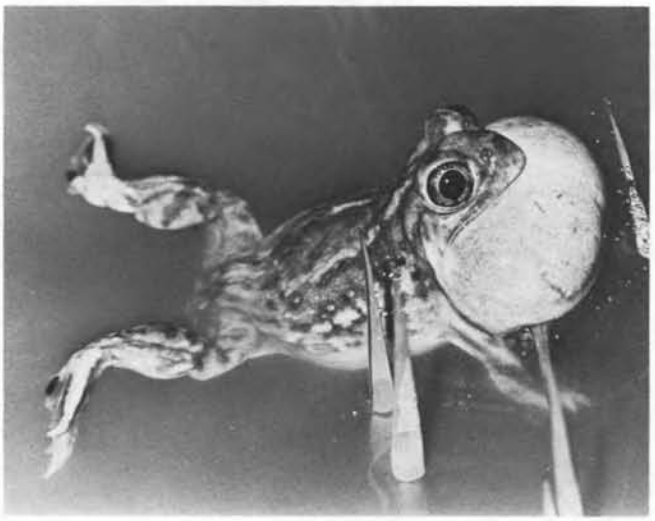
areas of its shorelines are alternately inundated during periods of high water, and exposed by draw-down. The constantly changing environment created by these water fluctuations offers many interesting and dynamic ecological problems. The large and diverse fish population and the many aquatic or water-haunting birds and mammals present vital problems for taxonomists and ecologists. Several large, well-isolated islands (on the largest of which are five small lakes or ponds), each occupied by extensive flora and fauna, including fish, amphibians, reptiles, birds, and mammals, are ideal for population studies.

It is impossible at the present time to list the number of species of plants and animals that occur in the region. Too little is known. Intensive collecting and research in the area began in the summer of 1949; the many species of plants and animals that have been collected - both invertebrate and vertebrate - have added new records for the county and even for the state, and extended the knowledge of the ranges of many species.

The herp fauna of this area is somewhat ecotonal having representatives of both the eastern forested areas and the south-western grasslands. However, August is a warm month in this area and herp activity will be slowed down. A list of the local herps will be available at the registration table. A living display of many of the herps of the area is planned for the meeting, as well as a photo-art exhibit.

The low relief Arbuckle Mountains about 30 miles to the north of Lake Texoma extend east as intermittent granite and limestone outcrops. Within this uplift is the Platt National Park (our country's smallest) famous for its mineral waters. Lake Murray and Lake Texoma State Parks, each with cabins and a lodge, are within 30 miles of the Station.

Contributed paper sessions will be held on Tuesday and Wednesday, August 15 and 16, while local field trips are planned for Thursday the 17th (Box lunches will be provided). Collecting is not permitted in the immediate station area. The theme of this meeting is "The Future of Herpetology" and appropriate paper presentations are encouraged.



An informal social gathering will be held on Tuesday evening and a banquet on Wednesday evening. Discussions of a possible amalgamation of the two societies will be an important part of the sessions.

Persons arriving by bus or train at nearby towns will be picked up, if proper notification is made on the registration form or by letter at least two weeks prior to the meetings. Those with private cars are encouraged to drive. Limited bus service will be provided from and to the Oklahoma City Airport (see below).

Lodging and meals will be available at the Biological Station, although only limited housing facilities are available for families. Limited camping facilities will be available at the Station grounds (with meals at the Station) and at nearby public camp grounds on the lake. Recreation facilities include volleyball and horseshoe courts, table tennis, swimming, row boating, and fishing.

Room and board at the Biological Station will be $8.00 per day, $5.00 per day for meals only. There will be a preregistration fee of $7.50 to cover the cost of the program, beer social, banquet and other materials. Registration after 15 July will cost $10.00. The call for papers, registration forms, and detailed information will be found in the center pages of this issue of HR.

The local committee for the meeting is composed of Dr. Charles C. Carpenter, Dr. Hobart Landreth, and Dr. Victor H. Hutchison (chairman).

Scaphiopus bombifrons, Norman, Oklahoma, April, 1969. J. R. Purdue.

EDITORIAL

SINCE 1968 the Society for the Study of Amphibians and Reptiles has been providing a service to its members that it cannot pay for with its present dues structure. The Herpetologists' League, similarly unable, provided its members with this same service since early 1971. This service is CURRENT HERPETOLOGICAL TITLES, a literature alerting list prepared by HISS and supported by the National Science Foundation. The "Titles" section has made up a major part of HERPETOLOGICAL REVIEW since its second number (April, 1968).

NSF reduced its support to HISS and similar projects in 1971, and it seems likely that "Current Titles," along with other bibliographic projects, will receive no NSF support in 1973. This means that if HISS is to continue to operate, it will have to seek additional support from herpetologists (as well as from other sources), whether or not SSAR and HL amalgamate.

The Society of Vertebrate Paleontology has apparently already lost its NSF support, and at this moment is polling its members to determine if they are willing to sustain the "Bibliography of Fossil Vertebrates" with $15 or $25 memberships.

Rather than waiting until the cut has been made, it seems appropriate to inquire now if herpetologists are willing to make additional payments so that they could continue to receive "Current Titles." ARE herpetologists willing to pay $5 more? $10 more? More than $10?

If HISS is not strongly supported by the "herpetological community," there would appear to be little incentive to try to extend this operation beyond the current year. -- HGD.

POSITION WANTED

George R. Pisani (Museum of Natural History, University of Kansas, Lawrence, Kansas 66044) is currently seeking a herpetological or public education position. Qualifications include an M.S. degree (St. Bonaventure Univ.); 2.5 additional years of graduate course work at KU; 2.5 years of high school teaching; experience as a college teaching assistant (geology and biology); a broad background in nature photography and maintenance of captive herps; broad experience with the organization and presentation of educational programs for adults and youngsters (including mentally and physically handicapped); experience with the maintenance of a major museum herpetological collection. Personal resume is available upon request.

MEETINGS AND SOCIETIES

CALENDAR 1972

18-23 June.....AMERICAN SOCIETY OF ICHTHYOLOGISTS AND HERPETOLOGISTS, Annual Meeting, Boston.

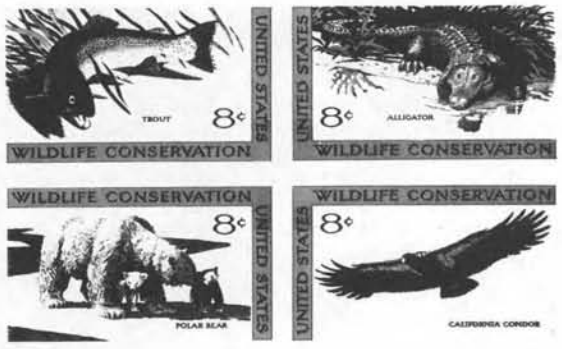
July.....SALAMANDER SYMPOSIUM, Highlands Biological Station, North Carolina.

14-17 August...Combined Meeting: HERPETOLOGISTS' LEAGUE and SOCIETY FOR THE STUDY OF AMPHIBIANS and REPTILES, University of Oklahoma Biological Station, Lake Texoma.

September....INTERNATIONAL SOCIETY ON TOXINOLOGY, General Meeting, Institute of Organic Chemistry, Darmstadt, West Germany.

24-30 September...INTERNATIONAL CONGRESS OF ZOOLOGY, Monaco.

26-28 December....HERPETOLOGISTS' LEAGUE, Annual Meeting (Cosponsored by the SSAR), Washington, D.C. (with AAAS).



CALENDAR 1973

June....AMERICAN SOCIETY OF ICHTHYOLOGISTS AND HERPETOLOGISTS, Annual Meeting, San Jose, Costa Rica.

4-11 August....FIRST INTERNATIONAL CONGRESS OF SYSTEMATIC AND EVOLUTIONARY BIOLOGY, Boulder, Colorado.

CALENDAR 1974

June....AMERICAN SOCIETY OF ICHTHYOLOGISTS AND HERPETOLOGISTS, Annual Meeting, Ottawa, Canada.

CURRENT HERPETOLOGICAL TITLES, XIX: 1970 - 1971

Herpetological Information Search Systems
American Museum of Natural History
New York, New York 10024

We have brought to your attention more than 14,000 current titles in the pages of this journal to date.

The titles of papers appearing in our lists were obtained by regular scanning of about 2500 journals directly and more than 1000 through secondary sources such as Chemical Abstracts Biochemical sections, Current Contents, publishers' catalogs, etc. Theses in English also appear, coming from such sources as Dissertation Abstracts and various academic publications. Abstracts of papers presented at various meetings and symposia are included. A complete list of the journals covered by us is published in Herpetol. Yearb. 1971. The coverage of books and theses in languages other than English is improving because a larger number of our colleagues bring those titles to our attention. Some copies have been mailed directly to us for inclusion in our lists. However, we would still appreciate being made aware of new books, reports, and non-English theses.

We realize that many of the titles listed are marginal to the field of herpetology as customarily defined. Many are published in journals of physiology, pharmacology, cytology, or embryology. Others are from medical journals, state fish and game publications, or pet animal journals. Thus, they are not aimed at an audience of herpetologists. All of them, however, deal in some way with amphibians and reptiles. As such, they may be of interest to at least some readers of HERPETOLOGICAL REVIEW. It seems better to let the reader make the selection from the list, rather than one of our small group deciding that this paper or that -- or this kind of paper -- is of no interest to anyone.

Our present policy, then, is to list the title of any current paper (e.g., 1971-1972) that is concerned with a member of a Recent order of amphibians or reptiles.

HERPETOLOGICAL REVIEW has appeared bimonthly, beginning in 1971. This means that the titles published here will be more current than the previous quarterly issues allowed.

Except for the omission of extinct orders, our list is comparable with that of the Amphibia and Reptilia sections of the Zoological Record, though ours is more comprehensive and considerably more current.

This list contains titles of books and articles that have come to our attention during the period 1 Sept. 1971 through 15 Jan. 1972. HR is computer printed and because of necessary production procedures there is a possibility that on occasion the titles from a single issue of a journal may appear in several issues of HR. Periodical title abbreviations follow the International List of Periodical Title Word Abbreviations (based on the Amer. Nat. Standards Comm. Z39.) (Chemical Abstracts Service, Columbus, Ohio, US.).

Acknowledgements. This list was prepared by the HISS staff: H. G. Dowling, I. Gilboa, I. Palser, and M. Coxe. J. A. Peters of the U. S. National Museum has continued to provide a welcome back-up program to our search of the literature, and G. J. Jacobs of NASA has kept us informed of the many publications and translations resulting from the United States space efforts. The library staff of the Museum have continued to aid our project. Special thanks to the members of the Herpetology Department, AMNH for their aid in cross indexing, which allows us to offer new services. We continue to rely on the advice and aid of James E. Bradley of the University of Rhode Island Computer Laboratory. We also wish to thank the many individuals who have sent us early copies of reprints for inclusion here.

This is contribution Number 37 of the Genera of Reptiles Project, which is supported by the Information Services Program of the National Science Foundation (NSF GN-707).

NEW H I S S SERVICE

HISS is pleased to announce the first issues of its planned series of special bibliographies.

THESE first numbers are no more than offset or xerox lists of titles. We expect to have several cross-indexed publications by the end of 1972.

THE FOLLOWING bibliographies are available now:

CHELONIA MYDAS.
PUBL HERPETOL (1): ca. 300 ref....$3.00

HERPETOLOGICAL TITLES in 1969.
PUBL HERPETOL (2): ca. 4000 ref...$8.00

LONGEVITY OF AMPHIBIANS AND REPTILES. *
PUBL HERPETOL (3): ca. 200 ref....$3.00

CHROMOSOMES OF AMPHIBIANS AND REPTILES. *
PUBL HERPETOL (4): ca. 1000 ref...$5.00

REPRODUCTIVE SYSTEM OF REPTILES.
PUBL HERPETOL (5): ca. 500 ref....$5.00

ALBINISM IN AMPHIBIANS AND REPTILES.
PUBL HERPETOL (6): ca. 200 ref....$3.00

* Updated from the list that will appear in the 1971 Yearbook of Herpetology.

[The prices quoted above are for INDIVIDUALS. INSTITUTIONAL prices are double the quoted amounts.]

INFORMATION ON

THE LAKE TEXOMA MEETING

15 - 17 August 1972

REGISTRATION FORM

Lake Texoma Meeting, 15-17 August 1972

(Please Print)

NAME:_____ INSTITUTION:_____

ADDRESS:_____

MEMBER OF: _____SSAR _____HL

Expected date and time of arrival by auto_____; by bus at Marietta_____; by plane at Oklahoma City_____, Airline and Flight No._____.
Do you desire shuttle service?_____.

	No. Persons	Amount
Registration. $7.50 per person ($10 at meeting)	_____	_____
Room and meals. Special package, Monday night (14 Aug.) through Thursday breakfast (17 Aug.) $20 per person.	_____	_____
Room. $3 per night per person.	_____	_____
Meals. Monday night through lunch on Thursday. Breakfast, $1.50 (T, W, Th); lunch, $1.50 (T, W, Th); dinner, $2.00 (M, T, W).	_____	_____
Banquet. Charge applies only to persons not staying at the Biological Station. $3.50 each.	_____	_____
	TOTAL:	_____

Names of others included above:_____

_____

I plan to stay at the _____camp grounds; _____motel; _____station.

Checks should be made payable to "OUBS" and must accompany registration forms. All meals and room charges are payable in advance with this form or at time of arrival at the Biological Station. Meal cards will be issued at the time of check-in. Rooms are limited and will be reserved on a first-come, first-serve basis; housing for married couples and families is very limited.

Mail this form with your check to: SSAR-HL Meeting, Department of Zoology, University of Oklahoma, 730 Van Vleet Oval, Norman, Oklahoma 73069.

DEADLINE FOR RECEIPT OF ADVANCED REGISTRATION IS 15 JULY.

GENERAL INFORMATION

● Registration - All persons attending the meeting are requested to register in advance by completing and mailing the Registration Form (below) before 15 July. Advanced registration is $7.50; registration after 15 July will be $10.00. This fee will pay the cost of refreshments during breaks, the Tuesday night social gathering, part of the banquet, printing, and part of the bus shuttle service. Advanced registration will allow the local committee to plan transportation and housing to serve you best.

● Travel:

Automobile - Excellent highways in the Lake Texoma area and their connections to Interstate 35 (north - south) and east-west Interstates 80 and 40 enhance the accessibility of the University of Oklahoma Biological Station by car from any point in the United States (see map for routes). Exit from I-35 at Marietta, Oklahoma, and travel east on Route 199 to Route 99. Travel south on Route 99 to Willis, Oklahoma, and the University of Oklahoma Biological Station. All major roads to the station are hard surfaced, and ample parking is available. Directional signs are located at road junctions near the station.

Train - Train service is limited, but the Santa Fe Railroad has one passenger train leaving Oklahoma City at 9:25 a.m. daily that arrives at Ardmore, Oklahoma, at 11:38 a.m. Anyone traveling by train must make prior arrangements with Dr. Landreth (or on Registration Form) for shuttle service from Ardmore to the Station.

Bus - Several buses leave Oklahoma City and Dallas for the Lake Texoma area. The closest stop to the University of Oklahoma Biological Station is Marietta, Oklahoma. Shuttle service will be available from Marietta to the meeting; however, please contact Dr. Landreth or complete the Registration Form section on travel to insure that your bus will be met.

	Leaving
Oklahoma City	Dallas
8:30 a.m.	7:00 a.m.
10:00 a.m.	10:00 a.m.
4:00 p.m.	3:40 p.m.
11:05 p.m.	6:30 p.m.

Commercial Plane - Shuttle service will run regularly from the Will Rogers International Airport in Oklahoma City to the meeting. Buses will leave the airport at 2:00 p.m., 7:00 p.m., and 10:00 p.m. on Monday, 14 August. Please indicate your anticipated arrival time on the advanced registration form. Buses will leave from the middle exit of the Baggage Area (lower lobby).

- Exhibits - There will be an exhibit of live specimens. Cages and terraria will be available for the exhibition of unusual specimens. Persons who wish to exhibit live animals (NON-VENOMOUS) should contact Mr. Robert Ball upon arrival at the meeting.

  There will also be a photographic and art exhibit during the meeting. Attendants are encouraged to bring their photographs and art work to the meeting for display. Photos and art work may also be sent to Mr. James R. Purdue, Department of Zoology, University of Oklahoma, Norman 73069, prior to 1 August; materials will be returned by mail or they may be picked up at the end of the meeting. Some mounting material will be available for those bringing photos.

- Social Events - A beer and chips social will be held on Tuesday evening and will be free to all registrants who stay at the Biological Station. A charge of $3.50 for the banquet will be made to campers and others who do not have all their meals in the Station dining room. There are no bars or restaurants serving alcoholic beverages near the Station - B.Y.O.

- Field Trips - Organized field trips will be held on Thursday, 17 August. Sign-up sheets will available at the Registration Desk and box lunches will be provided at a cost of $1.50 per person. Additional information on the trips can be obtained from Dr. Charles Carpenter at the meeting.

- Time - The Biological Station will be on Central Daylight Saving Time in August. Please be sure that all arrival times given for travel arrangements are in CDST.

- Call For Papers - We plan to accept all papers received before the Deadline. Any title received after the deadline can be scheduled only if another paper is cancelled. Please complete the "Call for Papers" form and submit it as early as possible, but before 1 June. Abstracts of papers will be available at the meeting and will be published in HR.

- Deadline - The deadline for receipt of the Call for Papers is 1 June. The deadline for receipt of the Advanced Registration Form and fees is 15 July 1972. After 15 July, the registration fee will be $10.00.

Private Plane - Landing strip facilities are available at the Lake Texoma Lodge for light aircraft. Transportation from this point to the meeting will be arranged at your request.

For Further Information on Travel - Contact:

Dr. Hobart Landreth
Zoology Department
University of Oklahoma
Norman, Oklahoma 73069
Phone: 405-424-3344 Ext. 41

● Communications - The Biological Station mailing address is: Willis, Oklahoma, 73462. The telephone service is through Kingston. The telephone number is (405) 564-2463. All correspondence prior to the meeting should be addressed to SSAR-HL Meeting, Department of Zoology, University of Oklahoma, 730 Van Vleet Oval, Norman, Oklahoma 73069, Not to the Biological Station.

Information on transportation (see above) prior to the meeting may be obtained from Dr. Landreth. Information on the program or accomodations may be obtained from the Zoology Department in Norman at the above address, [Telephone: (405) 325-4821].

● Lodging - Housing at the Station is limited and will be on a first-come, first-serve basis. Only a few apartments for couples and families are available and such groups should plan on camping or staying at motels. The price for rooms is $3.00 per night and includes one set of bed linen and towels. The most economical arrangement is the "package" fee of $20.00 for room and all meals from Monday night through Thursday breakfast.

Motels are available, but none are immediately adjacent to the meeting. Reservations at motels must be made directly by registrants. The following are all within 14 miles of the Biological Station. Rates usually average $6-$12 for a single room, except at Texoma Lodge where "luxury" prices prevail.

Motels in Area

Rooms are usually $6-$8 for a single, $10-$15 double, except at Lake Texoma Lodge where prices are higher. All motels listed are within 20 miles of the Biological Station. There are no motels near the Station. Reservations should be made directly with motel by letter or phone.

NAME	LOCATION	TELEPHONE (Area Code 405)

Willis Motel	Willis, Ok. 73462	564-2745

Campgrounds - There are 28 camping areas on the Oklahoma side of Lake Texoma and reservations are not usually required. The following campgrounds are within 14 miles of the meeting site. Campers may utilize the showers and sanitary facilities at the Station without charge. Due to the limited housing facilities at the Station, camping by family groups is encouraged.

Arrowhead Point - S. of Kingston on SH 70. Picnic facilities, toilets, boat launching ramp, boat rentals, tackle & bait, restaurant (11 miles).

Briar Creek Area - 12 miles S. of Madill on SH 99, then 2 miles W. on county road. 40 acres. Picnic tables, fireplaces, toilets, drinking water, boat launching ramp, fishing. Hospital in Madill. 14 day limit. Operated by Corps of Engineers (5 miles).

Buncombe Creek - S.W. of Kingston. Picnic facilities, drinking water, boat launching ramp (2 miles).

Texoma State Park - 5 miles E. of Kingston on U.S. 70. Picnic shelters, tables, grills, shower/latrines, drinking water, playgrounds, electricity-water-sewage hookups, travel trailer waste section, boat launching ramps, boat rentals, ski-tow service, guide service, enclosed fishing dock, boat dock/storage, marina, ski dock, swimming pool and bathouse. Tennis courts, shuffle board, golf, pro shop, driving range & putting green, horseback riding. Cafe, grocery store, gas, dining & convention halls, youth camp, resort lodge, housekeeping cabins, airstrip--paved, lighted and radio equipped (14 miles).

- Clothing and Laundry - The weather in August is usually hot and dry with occasional thundershowers and only light clothing will be needed. Coin-operated washers and dryers are available at the Station for the use of all registrants.

- Recreation - Recreational facilities at the Station include swimming, row boating, volley ball, horseshoes, ping pong, softball, and fishing. No license for fishing on Station property only. A temproary fishing license for use elsewhere on Lake Texoma is available for $3 in Willis near the Station.

FIFTEENTH ANNUAL MEETING
SOCIETY FOR THE STUDY OF AMPHIBIANS AND REPTILES
held jointly with
THE HERPETOLOGISTS' LEAGUE
University of Oklahoma Biological Station on Lake Texoma
14-17 August 1972

C A L L F O R P A P E R S

Papers on any herpetological subject are welcome. We would prefer that papers presented orally refer to work in progress or nearing completion. Presentation of results that have been published or that are in press usually are a waste of time for both author and audience.

Ordinarily we would expect an author to present no more than one paper, nor to request more than 15 minutes for its presentation. Exceptions will be considered, however.

An abstract of no more than 200 words must accompany this form to qualify for inclusion in the program (see other side). If an abstract is not received, the paper will be treated as a "title only" contribution.

PLEASE NOTE THE DEADLINE: 1 JUNE 1972
(SEE OTHER SIDE FOR ADDRESS)

(PLEASE PRINT OR TYPE)

TITLE: _____

_____

AUTHOR(S): _____

_____

COMPLETE MAILING ADDRESS OF THE FIRST AUTHOR:

CATEGORY IN WHICH YOUR PAPER SHOULD BE PLACED: Anatomy ( ); Behavior ( ); General Ecology & Life History ( ); Genetics & Populations ( ); Physiology ( ); Techniques ( ); Systematics, Evolution, or Zoogeography ( ); Other ( ).

Is presentation of a paper a requirement for your attendance at the meeting? _____. If yes, does this mean that you will not receive funds or time for travel if your paper is not on the program?_____.

HERPETOL REV 4(2): G APRIL 1972

A B S T R A C T F O R M

Please type the final copy of your abstract in the form provided below. Use the format indicated in the sample: AUTHOR(S) in capitol letters; (institution) abbreviated in parens; and title. The allotted space is adequate for a 200-word abstract.

TILLEY, STEPHEN G. (Smith Coll.). Life history and population structure of Desmognathus ochrophaeus inhabiting wet rock faces.

Populations of the salamander Desmognathus ochrophaeus inhabiting wet, vertical rock faces in the vicinity of Mt. Mitchell, North Carolina were sampled and the information on age at maturity was compiled. Size at maturity was found to increase with increasing elevation and at a given elevation individuals were found to mature at smaller body sizes when they do in nearby woodland populations. Two population level yielded sample sizes sufficient to permit determination of age at maturity and juvenile growth rates from juvenile size-frequency distributions. To the higher elevation, population sexual maturity is attained by delaying maturity about one year relative to its occurrence in the lower population. The juvenile growth rates of the two populations are similar to one another and to those estimated for nearby woodland populations.

USE A CLEAN TYPEWRITER AND GOOD RIBBON. This copy will be offset directly for the published abstract.

An abstract is an abbreviated, accurate representation of a presentation. Make the abstract as informative as possible, so that readers may decide, quickly and accurately, whether they need to obtain additional information. Do not include information given in the title. State the purpose, methods, results, and conclusions, either in that order or with initial emphasis on findings (results and conclusions). Make sure that the taxa of the animals studied are indicated either in the title or the abstract.

Make the abstract self-contained, since it must be intelligible without further information. Be concise without being obscure; retain the basic information and tone of the presentation.

Write most abstracts in a single paragraph. Normally employ complete, connected sentences, active verbs, and the third person. Use nontextual material such as short tables and structural formulas only when no acceptable alternative exists. Employ standard nomenclature, or define unfamiliar terms, abbreviations, and symbols the first time they occur in the abstract.
